When to Salt, Add Milk, Are Questions Discussed by Cooking Scientists

By MAXINE BUREN

One of the great questions argued by cooks since the first pig was roasted in that early man's burning hut is when to salt the meat. Should the salt and pepper be added before or after the meat has been cooked?

Most experts now agree that it makes little difference, as it penetrates only a fraction of an inch into the flesh anyway. Salt it when convenient and you'll be happy, say the scientists.

These fellows who study cooking from a scientific standpoint offer more good suggestions for the housewife. To achieve a smooth consistency in dishes using milk they say, add it at the right time. The wrong order of mixing makes it curdle.

When milk is combined with an acid food such as cream of tomato soup, the order is acid food into the milk. Pour the heated tomatoes into the cool milk. The mixture is heated and the soup served immediately.

In all mixtures the combining should be gradual and stirring constant. Never boil the milk in such mixtures.

Where mixtures contain no acid food, the combining can be done with less care, as danger of curdling is practically nil.

Knives or rough scouring materials may render glass cooking utensils more susceptible to breakage, say government experts. When once glass surfaces are scratched, whether with a diamond glass cutter or a mere kitchen knife, they may eventually break in that spot. They usually need only a soaking in a solution of that early man's burning soda to the water more resistant foods can be soaked off. Rubbing with dry baking soda will remove much of the yellow stain which remains after ordinary washing.

Parchment, or paper lampshades may be ruined if washed with water, but dirt can often be removed with milk. This is suggested by home economics specialists of New York state. Milk slips over the surface and does not penetrate because of its casein content. If a cloth roughens the surface, the experts say to pour some milk on the shade and roll it around, putting new on as it becomes darkened with dirt, then wipe off carefully.

The milk, used commercially to finish surfaces, leaves a slight film on the paper. If shade has two layers of paper the process of cleaning may be complicated and better left undone.

And here's a tip as to egg proceeds: eggs to be equal in price value and food value should be in the proportion of large, \$64, medium, \$56 and small, \$46. Now if large are \$64 and medium are \$54 and small \$46 it would be more for your money to get the mediums. Of if the large are as listed above, then there's more food value per one cent for the large.
