Bolivia's Metal Attracts Rearing World

The mineral wealth that attracted the Spaniards to explore the Andes 400 years ago still draws men to Bolivia. For tin, copper, silver, lead, tungsten and other metals are valuable to a rearing world. From 1540 to 1750 the Spaniards took gold valued at \$2,000,000,000 from Bolivian mines. Today the annual production of gold is about \$500,000, but other minerals are assuming increasing importance. Bolivia produces one-fourth of the world's tin supply, for example. An American company controls 80 per cent of this output. Petroleum is another important natural product. Chief center of this mineral wealth in Bolivia is the Potosi area. In an area of 57,000 square miles, ranging in altitude from 6000 to 20,000 feet, foreign capital is today mining everything from antimony to zinc. Here Germany and Great Britain and the United States and Italy are vying for control. Exports to the United States have increased sharply in recent years. But if the Andes are rich in minerals in this portion of Bolivia they lack other values. The climate is severe, vegetation is rare, transportation is difficult. Curiously enough, a vegetable is to be found at an altitude of about 23,000 or 24,000 feet. This is the yareta, resembling a huge mushroom without a stem. It is highly resinous and provides excellent fuel. One of the major mountain peaks of the Bolivian mining area is shown here on a 1916 stamp, Mt. Potosi. (Copyright, 1938, NEA Service, Inc.)
