

The University of Oregon campus was as hard hit by Friday's windstorm as any area in town. The above scene on University Street shows trees on a car in front of the Faculty Club. All over the University area, trees, some of them of historical and sentimental value, toppled as their roots lost purchase.

K. O. for Cars

The utility pole which appears to be a tree and the car-shaped flower pot from which it is growing seem to represent the main types of damage in Eugene.

Three little scooters were tipped over in front of the Student Union Building on the University of Oregon campus when Friday's winds bore down.

This shot of an auto peeking out of the bushes was taken shortly after the heavy winds struck the Eugene area. There was no accurate estimate of damage due to dents in cars, but body and fender workers will be busy for months.

Much of the tree toppling which came yesterday wouldn't have happened in August. As shown above, tree roots surrendered when the winds came — the rains of the past week had made the soil loose and soggy and the roots couldn't hold.

Another damage scene was at the Amazon housing project for married University of Oregon students. One student was killed by flying debris from the roof of nearby Roosevelt Junior High School. This car was stopped cold by flying lumber.
