Mental Power in Men and Women—Regarding this oft-discussed question, Mr. T. B. T. has been assured by some philosophers that there is a great difference between the minds of men and women. This has been attributed to the fact that one or the other sex is more highly developed. But this is not the case, as both sexes are equally capable of mental power. The minds of both men and women are capable of great development, and are equally capable of being trained to excel in any line of mental activity.

Peculiarities of Men.—Mr. W. C. B., an eye-witness of the exhibition of his Page 555, has written a letter to the Daily Impartial, in which he states that a man of his acquaintance has been the object of much curiosity. The man is said to be able to read the minds of others, and to predict the future. He has also been able to solve difficult mathematical problems, and to memorize large quantities of information.

Happiness and Poverty.—Happiness and poverty are inextricably connected. In all societies, the poor are the most unhappy, while the rich are the most fortunate. The poor are always seeking to acquire wealth, while the rich are always content with what they possess. The poor are always striving to obtain the necessities of life, while the rich are always indulging in luxuries.}

Balance Sheet of the Fisk University—The balance sheet of the Fisk University for the year ending June 30th, 1888, shows a deficit of $1,200. The deficiency is due to the fact that the income from tuition and endowment has not been sufficient to cover the expenses of the institution. The board of trustees are now making arrangements to raise funds to meet the deficit.

WILLIAMETTE FARMER.

TO COLLECT the orders of FLOW-It's about four o'clock, and all flowers contain six or eight of the same kind, and they yield their aromatic properties by the smell of the flowers or fruit. The flowers are not to be removed from their vase, and a flat dish of water, and setting a small bowl of water in the center of the table, this also being covered with water, will be sufficient. If the flowers are not to be kept in the vase, but are to be kept separately, they should be kept in a cool, dry place, and a small dish of water should be placed near them.

WHAT IS IMPORTANT—What is important is to be able to distinguish among chemists whether there is a change in the composition of the body, or if there is not itself a composition. If there is no change, we are not aware of its nature or cause.

When you have been running in the field, and are tired, stop and sit down, and let your breath come. If you have not had a good time, sit down and let your breath come. If you do not feel well, sit down and let your breath come. If you have not been able to do anything that is natural, sit down and let your breath come.
