Seven inches, or less, in daily and weekly per month.....\$1.00

DAILY, first insertion, per inch, \$1.00; each subsequent inser-

tion, ten cents per line, each insertion.

THE ARROGANCE OF IT.

In discussing the Eastern Oregon question, the politicians of the Willamette valley assume a very patronizing manner and speak of "giving something to the region that lies east of the Cascade mountains." This is arrogance, pure and simple arrogance, and arises from a wrong view of the situation. In the production of wealth from natural sources Oregon would be the same sad experience, and our sanitary authorities have even considered a quarantine against exotic cases and measures to stamp out the disease within the state.

Dr. Sewall's conclusion is: "That nothing is clearer in the history of demography than the fact that localities, if not climates, which were at one time favorable to the recovery of the consumptive patient later lose this beneficial power and even become hotbeds of the disease through cases contracting on the spot. That is, consumption, though at first exotic, later becomes indigenous."

The sooner these Western states and territories, whose clement climate is their most valuable asset, accept and act upon this conclusion the better it will be for their future welfare.

Consumption is a disease of civilization. Primitive people, like our Indians, who lived naturally, knew it not. But take an Indian and put him in a house and white man's clothes, and in nearly every instance he will develop the disease. The analogy is plain. If civilized people live in such climatic conditions as to require less clothing, less shelter, and to permit the proper enjoyment of outdoor life, their return, to that degree, to the primitive and natural way of life, lessens their liability to develop consumption. But the disease is transmitted by infection, and when its bacilli are present, distributed in the sputa of sufferers, no climate is proof against it.

It is evident that public opinion must accept and back up some comprehensive plan for the isolation and extirpation of this dreadful disease. It may well be worth while to inquire the facilities for isolation offered by certain desert tracts in Arizona. Near Phoenix there are already established camps of consumptives, but there may be found mingling with them rheumatic, asthmatic and hay fever patients, all seeking the same clear, dry desert air and congenital heat. Many a patient has in these camps exchanged rheumatism for consumption, contracted by infection.

In fact, there is strife among a large number of young ones who aspire to the throne once occupied by the now Senator Simon, and these young ones are going to divide Western Oregon politics into a melee that will resemble a picnic of Kilkenny cats. If Eastern Oregon people can attain a reasonable unity of purpose the governorship can be secured on the republican ticket for the next campaign.

ROAD WORKING PLANS.

The Walla Walla Statesman is wrestling with the problem of good road making, and has arrived at the stage of condemnation of the present badly conceived and more badly executed plan of having twenty or thirty supervisors doing the work in the time-honored patchwork manner. If the Statesman be able to evolve a plan for the proper handling of county roads, a very valuable public service will have been performed.

It would seem as though the railroad scheme would furnish the best possible suggestion to county governments. Railroad management is conceded as a rule to be the best administrative brain of the country. The railroad plan is to employ a man practical and experienced, to supervise the entire system and attend to all business pertaining to the work of building and repairing the lines. He is called the general roadmaster. Here in Pendleton William Bollons has his headquarters with charge of the general roadmaster's department. He handles the entire business through his deputies and other under men who are scattered over the system. He makes repairing and improving roads his special study and knows more about such things than would any army of men composed of one for every city, town and hamlet on the whole O. R. & N. lines.

This is the result of the best thought of the bright men who control railroads and who bring the best results.

Yet, with this practical demonstration before their eyes the average county court refuses to profit by the example, and goes on year after year working under the same old bungling regime.

The trouble seems to be that when a better plan is proposed—incorporating the railroad principle of road maintenance—the county commissioners are made aware of the objections of those

government bought out all the private rights there, and the springs are run by a federal superintendent.

Surely that is a precedent for joint state and federal action in providing a retreat for consumptives where they may be isolated under circumstances the most favorable to recovery and the best adapted to check or prevent infection of the sound.

It would be a boon to the states which have the unhappy reputation of being proof against consumption.—San Francisco Call.

OUR OWN PRESS CENSORSHIP.

Press censorship by the civil government in the Philippines was removed by Manila newspapers have been filled with scandalous and libelous articles in which the integrity, honor and name of the American authorities have been impugned, and that wholesale corruption against civil and military officers is charged.

There may be some grounds for these charges, though it would be well to draw the lines where there would be incitement to outbreaks. The dispatch says that Governor Taft is much incensed and will "severely punish the publication of libels or other law-breaking, and that a special translator reviews the newspapers daily."

The inference is that a press censorship is one of the features of the new civil government in the Philippines, and that Manila editors who give offense to officials or other individuals are to be subjected to punishment different from that provided for in the laws of libel now prevailing in this country.

In the recent supreme court decision in the colonial cases, it was distinctly affirmed by Justice Brown, one of the five majority judges, that the fundamental principles of the constitution must operate in our dependencies. Not one of these principles is more vital or highly prized by the American people than the liberty of the press.

No civil government in the Philippines will be entitled to the sanction of the American people and to the respect of the natives that does not concede liberty of utterance to Philippine newspapers, restricted only by the limitations imposed by the law of libel.

Philippine officials are entitled to just as much protection from newspaper attack as American officials—and to no more. Any attempt to subject Philippine editors to unusual espionage and punishment will be resented in no uncertain manner by the press and public of the United States.

Minnesota has exactly the same history. It has a dry climate, favorable to outdoor life, and as there were in pioneer times no cases of indigenous consumption it was widely advertised as a prophylactic climate, and sufferers sought it with good results that surprised medical men. The clear, dry air and invitation to outdoor life effected cures as remarkable as any that are in the record of Colorado and California. But the patients who found life there needed the state with death for others, and Minnesota no longer boasts immunity, and has fortunately lost her reputation as a sanitarian.

Southern California is having the same sad experience, and our sanitary authorities have even considered a quarantine against exotic cases and measures to stamp out the disease within the state.

Dr. Sewall's conclusion is: "That nothing is clearer in the history of demography than the fact that localities, if not climates, which were at one time favorable to the recovery of the consumptive patient later lose this beneficial power and even become hotbeds of the disease through cases contracting on the spot. That is, consumption, though at first exotic, later becomes indigenous."
