ON STOCK RAISING

(Continued.)

from its operation so many waste products that are so easily made into salable merchandise as has agriculture. While the packer has to provide himself with large chemical laboratories and expensive machinery for the manufacture of his offal into marketable products, the farmer has already at hand the most intricate machine and the most complete chemical laboratory in the cow, the sheep, the hog and the chicken for the transformation of his unused material into the necessary beef, mutton, pork, poultry and eggs. In Oregon by borthe necessary beef, mutton, pork, poultry and eggs. In Oregon by bor-ing wells for water and building fences to restrain the hogs and catthe many farmers have already solved the problem of saving the waste the problem of saving the waste which the present methods of grain harvesting entail. Upon the authoriharvesting entail. Upon the authority of such farmers in Gilliam, Wasco, Klickitat and Sherman counties, who have given it as their personal experience, it can be stated that each 160-acre wheat farm can produce a carload of 250-pound hogs every year. without feeding a dollar's worth of marketable grais to them. In each of our great wheat counties there are individual farmers, who are sending god hogs to market that have spent their entire lives in fields of volunteer rye, wheat and barley and on the stubble.

Fallacious Theories.

The school books of but half a generation ago taught that cereals would not grow west of the Rocky moun-tains. Today millions of acres of wheat, barley and oats furnish a very satisfactory refutation of this errone-ous teaching. There are yet though, many fallacious theories extant as to what will and what will not grow in

Our very best farmers, most optimistically assert that they can grow anything, and others, while compelled to admit that wheat will grow, still tenaciously contend that nothing clear will assert that we have the compelled to admit that wheat will grow.

ing else will.

There is abundant proof that the former are nearer the truth than the latter. Many of the former class of men are making what the others call waste land produce hay and pastur-age. Some use rye for this purpose, some sow alfalfa, still others sow peas and vetches.

It is eveidently then not so much a question of what can be raised, as of what wil be sown and cultivated. In Klickitat county Washington In Klickitat county, Washington, within a few miles of The Dalles, there may be seen a field of six acre on a steepy rocky western slope that has grown alfalfa for 12 years and will now yield a ton and a half of hay to the acre and furnish good maintenance pasturage for 18 full grown sheep the rest of the year. Four years ago the owner of this farm sowed eight acres more on summer fallow land.

Alfalfa for Hogs.
Prof. W. J. Spillman, while at Pullman, Wash., told me that he considered alfalfa to be the best summer pasture plant for hogs and other pastured steek, throughout all that portion of Oregon and Washington where rainfall is light and sunshine bounte-

Because this plant under irigation, produces from five to eight tons per acre, farmers seem to dispise the two tons of hay he can get without irrigation. I have maintained for a long time, that what clover was to the parts of these states having a greater rainfall, alfalfa would be to the dryer East of the mountains, subdivisions of these states, and that, too, without irrigation. There is a widespread idea falfa, the one necessary thing is water and lots of it. A study of the history of this plant teaches us that the one esential which must exist in abundance is sunshine. Don't worry about water for this plant. It will go down into the depths of the soil where moisture has been stored for years and find water for itself and

make lots of hay while the sun shines. This is an aspect of the agricultural problem to every one interested in what is now range country of Eastern Oregon. Owing to the increasing disappearance of the native shrubs and grasses, the complaint has become quite general that the ranges are everstocked and that each year its capacity for the maintenance of cat-

le and sheep is decreasing. It has been the history of every new country that the original vegetation which nature had supplied to control and distribute the rainfall has been ruthlessly destroyed by a short-sighted policy of exclusive grazing, with no rest for the re-seeding of the native grasses and no attempt at cul-tivation of new crops.

Result of Cultivation

But though the stockmen's occu-pancy of a country, may at first seem to result in the destruction of the range, the numerous settlers who always follow in his wake and the de-creased hay production, bring about a new set of conditions far ahead of those first existing. In the valleys irrigation brings bounteous results, fencing and cultivation may speedily bring about a restoration of the semi barren range to active production. Cultivation that will enable such soils as ours to retain all the moisture that may fall, will insure a crop of almost any cereal that may be sown. Moisture stored within the soil does the crop more good than that which falls on it while growing. Data of the North Dakota experiment station shows that an inch of available water in the soil is of more value to the growing crop than two, or even three inches of rain upon it, and that could all the moisture which falls be preserved, only half of North Dakota's 17 inches of annual rainfall would be needed for a crop of wheat. eeded for a crop of wheat. Coming nearer home, the Utah ex-

periment station has shown the possi-bilities of arid farming to be so great that we can no longer consider any of our territory where the soil is just as tenacious of moisture, too dry, for grain or hay. There is no part of the
