Homemaking

Grease floating on the dish water or clogging in the sink drain pipes is a strong hint that fat, so precious in wartime and still greatly needed for salvage, is being needlessly wasted, points out Miss Elizabeth H. Boeckli, home demonstration agent.
Though every good housekeeper knows that grease should never be poured into a sink or drain, not everyone is careful to scrape each layer of fat from frying pan, platter and plates, Miss Boeckli stated. Some of the fat remains can be salvaged and used again for cooking while the rest should be strained into cans and carried to the butcher.
Chemists and household equipment specialists of the U. S. department of agriculture advise keeping sink drains in running condition by pouring down boiling water every few months as this procedure softens and carries away grease. Before using any drain cleaners on the market, the housewife should understand the action of the lye in these preparations, Miss Boeckli emphasized. Soda lye combines with grease to form hard soap. Potash lye forms soft soap. Many drain cleaners are made with soda lye because it is cheaper and easier to obtain than potash lye and, if the pipes do not contain a great quantity of grease, may clear the pipes effectively.
