JUNIORS ADD TWO PLAYERS TO TEAM

Woodburn—The American Legion baseball team held their regular practice Sunday morning at Legion Park. Two more players, Glen Halman of Aurora and Gerald Heribarger of Hubbard were signed up. The team had a light infield practice. Clarence Oberst of last year's team has been shifted from short stop to third base and seems to be capable of handling the hot corner. Short stop is the weakest place in the infield, Conye being the only shortstop on hand and he has not had much experience at this position. Second base is well taken care of by Coleman of last year's team and McCon of Hubbard high school. First base will be held down by Bonney. He plays outfield for Woodburn high school and will have to get accustomed to the initial sack. The catching department is very strong with Veneit, last year's catcher, and Higginbotham of Hubbard high battling for this position. The outfield will also be strong with Gant, Wengenroth and either Stevens or Heribarger patrolling the outer garden. The last two are pitchers but either can play in the field. The pitching department should be able to give a good account of itself. Stevens, Ryan, Batleson, Heribarger, and Hults will battle it out for the mound jobs.

The couple were married in 1929 and have had six children, four of whom have attained their majority.

THE SECRET IS OUT

76 ANTI-KNOCK LEADERSHIP MADE POSSIBLE BY BLENDING OF 4 GASOLINES

IN THE way 76 is made we find the secret of its anti-knock leadership.

FIRST Crude oils of high quality are run through modern, continuously operating stills to produce two "straight run" gasolines—one light and the other heavy. The light gasoline is not only rich in fractions which provide quick starting and rapid acceleration, but it has high anti-knock value as well.

SECOND The heavy gasoline gives speed, power, and good mileage but in its original form is deficient in anti-knock qualities. To build these up and still retain its other characteristics it is "reformed" by a new process which operates at temperatures above 950° Fahrenheit.

THIRD Carefully selected heavy oils, much heavier than kerosene, are subjected to a combination of high temperatures and tremendous pressures. This process produces a "cracked" gasoline of extremely high anti-knock value.

FOURTH Natural gas produced with crude oil from the wells is treated to recover from it a small amount of volatile material called "natural gasoline." This is collected, transported under pressure to the refinery, and "stabilized" to remove from it the fractions which would cause vapor locking trouble to use. The "stabilized natural gasoline" has the ability to maintain high knock resistance under severe summer operating conditions.

THEN All 4 gasolines are purified to be certain that objectionable gum, acid, and other harmful ingredients are removed.

FINALLY The 4 gasolines are scientifically blended to produce 76—the highest anti-knock non-premium fuel ever offered.
