An electro-chemical process by which wood and water are actually converted into the purest and sweetest sugar is being demonstrated in a western city. The machine, which costs only \$1000, is composed of a water-boiler, a furnace for heating steam until it turns into hydrogen and oxygen, a retort in which the charcoal is reduced to a gas and mixed with the hydrogen and oxygen, a water tank in which the combination of gases is cooled, an air compressor and a set of highly charged electrodes. In a test the machine's output of chemically pure sugar was 70 pounds in 30 minutes. It is claimed that sugar can be produced chemically at one cent per pound from elements almost as free as air.

This order is effective in all first-class offices in the United States. Probably the only benefit derived from such stamping is to determine how long a letter had lain in a local office before delivering.
