SILOS. Pathetic Story of a Scene Which, Sconer The Secret of Success in Preserving the or Later, Occurs in Every Household,

Contents of a Sile. The silo is a device intended to exclude the air from green food fit for the consumption of cattle-as corn-stalks, clover, rye or other forage crops. It is a scientific advance upon the ancient method of preserving green food by covering it with earth. The silo is a pit usually constructed of masonry, the sides and bottom of which must be waterproof, into which green fodder is packed and pressed down with such necessary covering and weights as to exclude the air and thus prevent fermentation. The pits are usually twenty feet in depth, and are most cheaply constructed if nearly square in form and so divided Boot and Shoe Store he took his hat; "I must go to a patient who is dangerously ill. This evening I will call again. I have left instructions ered with grooved planking upon which the superincumbent weight is placed. This form of division is advantageous in the ensilage without removing the presshe was professionally discreet and sure from the remainder. The pits silent.
