PER 1,000 PEET, ROUGH, Health and Vigor of Trees-Apple CLEAR. Worms and Remedies Described-A System of Pruning.

I F DELIVERED IN HEPPNER, WILL ADD In a former paper I gave some facts as to the causes of loss of vitality in trees L. HAMILTON, Prop.

and why such want of vitality gave still further decrease, by insects and diseases. There is one other thing that greatly reduces vigor and vitality of fruit treespruning, as generally practiced. All Perhaps You Don't Know Us, gruning is of course unnatural, therefore, as we are obliged to prune or rather cut back, on this Coast for special reasons, we should try to do it as much as possible without transgressing nat-"Areado Chambers." Hours I to II s. M. Lady Attendants.

We fill must orders same day received (eccurely scales) periodicy. If not as represented we will reined your movel or Superfluons Hair town the Face, Nock and Arms, or Moles and Birthmarks. Made in or a passe, only a few toinutes application is required. It is powerful, yet mild in its effect, It dissolves and destroys the foliales of the hair without the slightest pair, in jury or dissolvestion to the most delicate skin. Try it. Our Union 21.00 per Bottle. Then to the most delicate skin. Try it. Our Union 21.00 per Bottle. The most delicate skin. Try it. Our Union 21.00 per Bottle. The the property of the season of the most delicated in the property of the season of the property of the season of the periodic states of the most delicated in the spidents of the most delicated that we should wear a covering for the head. When the spidents is considered in the property of the periodic states of the most delicated and provide that we should wear a covering for the head. When the spidents is not an indication of its morita. Try it. Price, 31.00 per Bottle.

'QUEEN ANTI-ODOR?' (powlered form) applied to the parts allays excessive perspiration, of the morita try it. Price, 31.00 per Bottle.

'QUEEN ANTI-ODOR?' (powlered form) applied to the parts allays excessive perspiration, and personally curse offensive feet, armpite, etc. A most delightful and harmless remedy. Price 50c. Our 'ONDOLINE?' (liquid, pure and harmless), when applied to the skin restores and beautifies the Complexion; removes and prevent Tan, unabure, Freckies, Timpies and Harkmark. This removed preparation cannot be excelled. A single application has, a marrelous effect, and each in refund your money. One Bottle will restore the complexion. Price, \$1.00.

QUEEN TOLEC Ca. Your preparation formulas (after a careful analysis), I am free to say are harmless, and certainly effectual if used according to directions. J. J. Hesse, M. D. 484 Freeman Ave.

Bemit by F. O. Urder, Registered Letter, or Draft ural laws. A general right system of pruning is too long a subject to go into here, but as it has such a bearing on the future vigor of the orchard it is desirable to give the fundamental principles. If a wrong start is made a vigorous, healthy, fruitful orchard can never be

THE APPLE ORCHARD.

AND INSECT ENEMIES.

First-The tree when planted should be cut back to ten to twenty inches from the ground.

Second-Branches should be started not more than ten inches from the ground and the lower branches should be cut back to within a few inches of the trunk at each winter pruning.

Third-A tree so started never will need any other pruning except to cut hen tarkeys a few days before they be-tack the too great growth on the upward and outward surface of the tree's head each winter. If cut back one winter the upward and outward shoots must be thinned out the next. On this thinning out a great deal depends, and if it is not done the orchard will be spoiled. do not like to be disturbed when on their Cut out clean all these shoots but one or

Fourth-Never do any pruning on the inside of the head of a pear, apple, plum or prune tree when started on this system. But constantly shorten in the lower side branches each winter,

BUGS AND DISHASES.

The first great enemy of the apple, pear and quince is the apple worm or codling moth. This is the larva of a pretty, little, delicate moth, which lays its eggs on the young fruit soon after the petals fall in the spring. The moths continue to lay through the entire season. In California there are two or more broods. When these eggs hatch the young caterpillar begins to feed on the skin of the young truit and soon ourrows its way directly into the core of the apple, usually by the way of the caryx or eye which at that season of the year opens upward. We have been taught that the moth, as a rule, deposits her eggs in the eye of the apple, but this observation shows to be the exception rather than the rule. The egg, which is very minute, is deposited on any portion of the apple and the minute larva seeks the calvx for shelter. Then, when feeding on the skin of the apple or in the catyx, if there is a virulent poison present it will take it with its food and is killed. There are three practical mineral poisons. Paris green, London pur-ple and arsenic or arsenic acid. These are soluble only to a very slight extent in

water. The first two are most generally They are in the form of fine powders and are used by simply stirring one pound of either into 200 gallons of water and then spraying the solution over every part of the fruit and foliage of the tree, using a very fine spraying nozzle with considerable force from a force pump. Be careful to keep the mixture stirred up from the bottom of the tank. Both of these powders are insoluble in water and soon settle to the bottom. This would give no effective poison at tween the two ends, four inches apart,

imes and entirely too much at others.

To kill the codling moth the orchard serted to act as dibbers. The weight of times and entirely too much at others. with the lime, sulphur and salt com- into the soil and thus holes just right for pound. The sooner it is done after the the young onion plants are made as fast leaves fall the better. This spraying as a person can walk. The Mealy Bug. The mealy bug has made more people

niserable than almost any other insect. under sides of leaves, is very sluggish in its movements, and looks quite innocent. It soon materially injures plants upon an ounce vial of chloroform, a small camel's hair pencil, and touch them on the back with the pencil dipped in the chloroform. Many other nexious insects can be instantly killed in this way,

industry may be expected to arise.-

Boston Journal of Commerce. In our bug collecting days we took a vial with a ground glass stopper into which we dropped a little lump of cya-nide of potassium, and over that a wisp of cotton. Then when we found a bug we dropped it into the vial, and on the downy bed he quickly and quietly died. The fumes from this most deadly of poisons quickly kills all insects. It seldom injures vegetables. Advantage has been taken of this to free trees, especially the orange, when scale bug infested, by covering them with a tent and generating the cyanide gas beneath it by de-composing the cyanide in acid. Here is an open field for valuable experiment with this poison. It is possible that a weak solution of the cyanide in water

LIGHT BREAD

These are of several species, but all are so nearly alike in habits that the term, mealy bug, does well enough for all, it is a flat scale-like bug about as large as a half of a kidney bean, nicely fringed around and scalloped, and covered with a white mealy powder. It feeds on the which it feeds. The mealy bug is so tenacious of life, and so well protected. that few things will kill it that will not also kill the plant. Therefore the old slow process of hand picking is about the most feasible remedy. There is a very good means of killing them. Take

A London contemporary states that the ofly matter present in grape stones has lately been made the subject of a chemical investigation, with a view of ascertaining to what use it can be put. The result has been to show that the oil is by no means dissimilar to castor oil, resembling that substance in its high poor, sandy soil, fertilized with manure acetyl number and iodine number, a resemblance which extends to its property the crop was cut for folder and on of yielding Turkey-red oil on treatment another seven cattle and two colts were with sulphuric acid. Direct dycing tests showed the product to be excellent. Should this result be confirmed a novel

might have most valuable uses in controlling noxious insects.

Doings at the Experiment Stations. A trial of silage made from apple pomace as food for pigs resulted unsatisfactorily at the Illinois station. The pomace kept well and chemical analysis of it showed an apparently good composition for feeding purposes, but the pigs are very little of it. At the Georgia station nitrogen was

so that their number will be divisible by twelve.

found to be the most effective element in fertilizers on oats; cotton seed meal was the only substance that paid a good The Fultz made the largest yield of any wheat grown, though the Walker, which is a week earlier, is considered the most trustworthy, one year with another.

At the Illinois station two trials were made, in each of which two pigs were fed soaked corn and two others dry corn, with no other feed. The pigs fed soaked corn ate more and gained more than those fed dry corn. In one trial they gained more and in one less in proportion to food eaten than those fed dry corn. The differences were not great in

The first of a series of experiments with rye grown for green forage in the winter has been reported from the Florida station. The rye was planted broadcast and in drills on three plots on and commercial fertilizers. On one plot pastured. A considerable amount of green forage was easily and cheaply produced during the winter and early spring.

Second Crop Potatoes. The practice of growing second crop potatoes for seed has long been practiced in the east, and the truck growers in the neighborhood of the large seaboard cities have found out how valuable the product from such seed is. The knowledge and its benefits are spreading to the west. By this method both earliness and better quality of tuber are secured.

—Farmers' Review.

Sugar beets are proving to be the best feed for cattle yet raised in Southern California, and as such are paying better returns than any other farm product grown in that section.
