SWEET CORN.

Hints Concerning Its Cultivation—Early Medium and Late Varieties. One-half of the cultivation of the corn crop consists in reducing the soil to a roughly broken up and mellow condition previous to planting. A rich, warm, alluvial soil is best. A wide variation gained by planting sweet corn before the temperature of soil and atmosphere are right for growth. The seed will make no progress until the weather is

warm, and in many cases it will rot. All varieties of sweet corn may be either sown in rows 41/2 feet apart and the seed placed about eight inches apart in the rows or planted in hills at distances of than Seizure and Wilson's Progress. National Bank of Heppner. three or four feet each way, according to the variety grown and the richness of the soil. Manures and commercial fertilizers ought not to be buried too deeply, for the root growth of the plant is near the surface. Shallow culture is now generally conceded to be better than TRANSACTS A GENERAL BANKING BUSINESS deep culture for the growing crop.

Treatment of Chicks

After hatching leave the chicks in the nest for twenty-four hours. Take the hen away, feed her well and give water to drink. On coming out of nest feed chicks on bread soaked in milk and squeezed dry, or give dry bread crumbs.

After a few days give chicks all they can eat, as often as they will, of bread and milk or bread crumbs. After second day give milk or water in shallow pans for drink. Be careful bread is not fed too sloppy or looseness will follow.

fully. After two weeks feed wheat sparingly at first, afterward all they can eat, particularly at night; vary with crushed corn. Be careful the chicks are not stinted of food or they will become stunted. Remember that a chick stunted in the first five weeks of its life will never make a plump fowl.

every day or second day. As the early chicks grow large they should be removed from the younger ones or the latter will be crowded and make no of the plants indicate. progress.-A. G. Gilbert, Ottawa Station.

Placing Hives in the Apiary.

A Minnesota beekeeper, writing in The American Bee Journal, says: "I drive four stakes in the ground, making a square of 30 by 36 inches and 18 inches igh, to which I nail two pieces of board 4 feet long, the 36-inch way. Next I lay a spirit level on the edge of the boards and drive down the post so that the and drive down the post so that the cross board is in perfect level from one end to the other and across the 30inch way from one board to the other. On this board stand I place the bottom have been grown on the experimental

put a colony of nees and on the other an empty hive. I clip the wings of my queens in the spring, so when they swarm I cage the queen and exchange the hive from one bottom board to the other while the bets are in the air and place the cage on the bottom board in front of the empty hive, which is now on the bottom board that the bees are acquaint-

EXPERIMENTS WITH OATS.

Results from Many Varieties Tested at the Ohio Station.

Fifty named sorts of oats were sown in a comparative test at the Ohio station, in 1891, on bottomland. The varictics were divided into four groups: L. Those of the Welcome type, having a coarse, weak straw, with plump, heavy white grains. 2. Varieties with open panicle and white grain, but the grain more pointed and lighter in weight than Welcome. 3. Varieties having open panicle, but with black or mixed grain.

4. Varieties in which is Varieties in which the panicle is more or less one sided, commonly called "side In each of these groups a typical variety was adopted as a standard, and was sown on every third plot through out the group, so that every variety had a plot of the typical sort growing along-side. Welcome was chosen as the standard of the first group, Wideawake for the second and Seizure for the fourth. The four mixed sorts sown in the third group were compared with Welcome.

The average yield of eight plots of Welcome was 47½ bushels per acre, and the greatest variation between neighboring plots was two bushels Ten plots of Wideawake averaged at the rate of nearly forty-nine bushels per acre. Banner, Early Prize Cluster. in the time of planting is allowable in most sections. At the north nothing is California White Scottish Chief, Probstiver, Star of North Dakota, Early Dakota and others were in this group. Five plots of Seizure averaged fifty-six bushels. Golden Giant, Giant Yellow French and Egyptian yielded about the same. Black Tartarian, Prince Edward and Alabama fell three to eight bushels below Seizure.

Of the mixed sorts with open panicle Monarch and Rustproof yielded four to eleven bushels more than Welcome, and Black Russian and New Red Rustproof two to nine bushels less. Rustproof was the only one of these varieties that kinds on the average. The varieties of grain, averaging about thirty-three pounds per bushel against thirty pounds on the average for the other kinds, but all vields were calculated in bushels of thirty-two pounds. The side oats had

Soaked Food for Chicks. Soaked stale bread collects in the bowels and forms a hard mass, resembling a cartridge for a revolver, and is stone: this obstructs the passage and will not move. The chick droops around a few days and then dies. Several such cases came under our notice the past two years. Stale soaked bread formed a large part of their daily food. On adjoining farms where bread was not used no cases occurred. We mean in chicks and young turkeys, says The Poultry News. 'The Fanciers' Journal, commenting on the foregoing, says The early varieties start with Cory's "More chicks are sent to an early grave Early at the head of the list; Early Mar- by 'soaked food' than anything else. A blehead next. Then come Early Adams, chicken likes granulated foods best, and few days after Adams Early), and Shak-chicks. Cracked rice, worth about 814 Stowell's Evergreen, a late standard the chicks require plenty of drink. A third, mixed with milk and baked hard.

coarsely and fed dry."

It is a popular belief that hard boiled eggs furnish the best possible feed for son, large early, 8-rowed; Perry's Hy-brid, a 12-rowed variety; Hickox Im-Fancier takes exceptions to this general newly hatched chicks. The Southern rule and says: "We do not besitate to denounce all such epicurean dishes as sweet corn are Stowell's Evergreen, a hard boiled eggs, milk toast, etc., and standard late corn; Mammouth, Tri-tumph, Egyptian and Livingston's Golden tainable. For young chicks we know of nothing better than cornmeal cooked into what is commonly known as johnny cake. This at first, and afterward wheat and cracked corn."

> A farmer communicates his "reflections while plowing corn stubble" to other will put the bulk of its gain upon Rural New Yorker, as follows:

With good land the fodder will pay for all the labor of raising it.

The corn planter is the farmer's friend. In nine cases out of ten, a tile drain in If chicks appear sick or drooping look a wet cornfield will pay for the tiles in for lice. Dust with insect powder careprobably more than pay for them. With wheat at \$1; hay at \$10, and corn

Bordeaux Mixture.

The Bordeaux mixture consists of six pounds of sulphate of copper, four pounds of lime and twenty-two gallons of water, and is applied by means of a If the hen and chicks are placed in spraying machine. For use on potatoes small coops, the latter should be cleaned Paris green can be added; the mixture to be applied as soon as the potatoes are

Farm Notes.

Three essentials for successful wheat growing are good drainage, good tillage and good seed.

Alfalfa is said to have proved a surprising success upon the sandy soil of south central Kansas wherever tried. Three crops the first year and good hog

The Oregon experiment station report mentions beal as one of five of the best varieties of white wheat, which heards of two hives, on one of which I grounds for two succeeding years.

ORNAMENTAL WATER FOWL.

Some Information Concerning Handsome Breeds of Swans. Every town and village, however

small, now has its park. Most of these A cow that has ceased to be profitable tontain miniature lakes which ought to as a milker on account of age is usually have, if they have not, beautiful stately worth more for leather and for fertilizer swans in them. It will seem odd to reworth more for leather and for fertilizer than for beef. For beef she is worthless because she cannot be fattened to pay for what she eats. In other words a dairy cow can never be converted into beef without a loss. If she is a real dairy cow she will be worth more in the dairy than in beef, so long as she is in dairy condition. When she passes that period it is too late to fatten her at a profit.—Jersey Bulletin.

Land Office at La Grande, Or. June 1, 1892.

The Poultry World gives, accompany-ing the illustrations below, the following information about some of the hand-

somest breeds of swans: These large, white, long necked ewimmers appear in the public parks of our large cities, coursing over miniature lakes and along the shores, taking bits of biscuit from the hands of the children of the sovereign people, not rejecting peanuts when offered.

Speaking of the swan in general terms —the white species of Europe—a de-scription may be short indeed: A white plumage entire, black legs, a red bill, urmounted by a black knob, sometimes called the berry. This tells the story. Everybody knows that the swan has a very long neck, and it may be noticed that the bill is nearly of equal width in front and at the base, and that it is high in the center. They are not only strong swimmers, but fly with lightness and ease, going in flocks. Swan's down is very soft and fine. The food consists of Island, Dakota Gray, Black Prolific and grain, tender plants found in the water, mails, fish, etc.

When these birds are let alone, and have free swing in making their nests, they pile up material about two feet high and five feet in circumference. The sitting down place is in the middle and upper part, in which are deposited generally less than nine eggs, of a grayish green color and very large. The time of incubation is from five to six weeks. equaled Seizure in yield. It will be seen The male swan "hangs around" during that the side outs outyielded the other this process, and takes an interest in the family prosperity. When just hatched the Welcome type produced the heaviest grain, averaging about thirty-three gray color, and with no delay accompany the old birds to search for food. After awhile they are covered with feathers of a dark brown color, but change gradually for a period of nearly as a rule a much stiffer straw than oats two years, when they become purely of other types—a point greatly in their white. Many of these birds live to a good old age. It has been said that a swan's chances for living seventy years are as good as those of a temperate man who takes a cold water bath daily.

BLACK NECKED SWANS. Another species worthy of mention, on account of handsome appearance and large size, is the black necked swan found in the southern part of South America, having a range from the Straits of Magellan as far north as Brazil. The nasal knob or berry on this swan is red, feathers on neck and head jet black, except white rings about the The body plumage is pure white and the feet are pink. This peculiar arrangement of colors may be called 'fancy," and it is certainly interesting to those persons who abhor monotony. The black necked swans have been do-mesticated, stand confinement well and breed freely in that condition.

Beeves for Fattening.

Not all animals have the same aptitude to lay on flesh or flesh of the same quality. There is not only a great difference in breeds, but an almost equal difference in individual animals of the same breed. There is not only a difference between animals in their ability to digest food and convert it into meat, but different animals put a gain on their carcasses in different places. While one will store it on the most undesirable parts, like ribs and forequarters, anloins and hind quarters, and as a pound A fall plowed cornfield makes a full of loin or ham is worth more than twice as much as a pound of the fore quarter or inside tallow, too much attention cannot be given to the selection of animals for beefmaking, not only of the best beef breeds, but also of the best beef types of these breeds.

With a little experience and close attention one needs make but very few mistakes. By selecting Shorthorns or Herefords or their grades and those with heavy hind quarters with a large development of hams and broad, strong loins, small heads, fine horns, mellow skin and fine, silky hair and a general thrifty appearance, one will not often be disappointed in the result. - Rural New

Gray horses live longest, roans next. So it is said.

Potatoes for Pigs.

In experiments conducted at the Wisconsin station it was found that in fattening hogs 789 pounds of potatoes took the place of 178 pounds of cornmeal, or, in other words, 443 pounds of potatoes were required to take the place of 100 pounds of cornmeal. This makes one pound of cornmeal worth nearly 434 pounds of potatoes. As several lots of animals were experimented on it is hardly possible that the results are very far from the average.

One noted wheat grower says that for wheat he wants the ground fine and firm, and that there is little or no danger of having the ground too firm.

NOTICE OF INTENTION.

Land Office at The Dalles, Or., June, 15, 1892.

Notice is bereby given that the following named settler has filed notice of his intention to make final proof in support of his claim, and that said proof will be made before the County Clerk of Morrow County, Oregon, at Heppner, Oregon, on July 28, 1892, viz.

(Hd No. 2101) for the SE's, SEE, See 3, NE's, See 10, and Ny NW's, See 11, Tp 5 8, 825 E.

He names the following witnesses to prove his continuous residence upon and cultivation of, said fand, viz.

W. E. Kahler, J. W. Banister, A. M. Royse, D. N. Hardman, all of Hardman, Oregon.
