CHEESEMAKING

The Views of Instructor George A. Smith on the Subject.

The object of ripening the milk before adding the reonet is to have a sufficient than more showeling in firing. The smount of acidity developed so that the stoker must know how to put the coals on so they will not burn too quickly nor deaden the fire. He must know how to curd will work along in good time, and tiake a good, solid cutting, well flavored stir or polce the fire so as to get a 1, or

The general principle underlying the nearly all, the heat out of the coal. Service in the fire room is divided into rily upon the action of the rennet in cosignaling the case of the milk and in freman works and sleeps alternate four that way holding a larger portion of the nurs. After the first day from port fut. The sugar and albumen of the milk are principally carried off in this out to the bare baraduring the first hour way. The rennet is principally obtained of each watch. Thus, in a voyage, all from the mucous surface of the fourth stomach of a suckling calf. It is pre-four hours. The steam goes down a bit served for use by carefully cleaning in the hour while the cleaning is going without washing it and it is then rubbed on. The stokers shovel into the furwith salt and dried. When wante i for use it is soaked in weak brine, and the three hundred tons a day. The ship liquid thus obtained is used to coagulate the milk.

When the latter is found to be in proper condition sufficient of the rennet solution is added to cause the mila to begin to thicken in from lifteen to eighteen minutes. It is then allowed to stand until the curd is firm enough so that by laying the back of the fingers and hand on it next to the side of the vat and gently bearing it away it will cleave off. For cutting the curd knives containing several blades about half an inch apart are used. When cut the curd is left in small cubes, each not more than half an inch in diameter.

It is necessary to use every care that the pieces of curd may be even in size, so that the heat and rennet will act together and on all alike, producing an even curd, without which it is impossible to make fine chcese. The main loss of fat takes place in the process of cutting and handling immediately following. The globules of fat on the ex-posed surfaces are easily detached, hence the necessity of carefully handling not to mangle and bruise the curd, and thus increase the amount of fat lost.

As soon as the curd is completely cut t is stirred very gently for ten or fifteen inutes, until the outside of the pieces shows the appearance of a slight film, and the whey commences to separate freely from the curd. The letter is then gradually heated to a temperature of about 98 degs. Fahrenheit. During the process it is kept in constant but gentle agitation. The heating stimu-lates the action of the rennet, which brinks the casein and expels the moisare from the kernels of card. It is very important at this time that just the right amount of moisture should be sep-arated from the curd. If too much is lriven out there will be a loss in yield and a coarse, hard textured cheese.

On the other hand, too much moisture nakes a choose that cures too fast and which will get off flavor quickly, for the reason that the retention of so much moisture causes the conditions that a: the most favorable to the development of the bactoria of putrefaction. When sufficient development of acid. To tell mestication.

lraw the whey from the curd requires the best judgment of the maker, as it is one of the critical points in the manufacturing process. The most common test used to de-

FIRING AN OCEAN STEAMER. Something About the Labor Performen by a Scoker-

A Scottish contemporary thus de scribes the firing service on board ar ocean greyhound: On the City of Pari there are sinty fromen, who feel the fery maws of fity-four furnaces, that wrote steam in nine bollers. Fifty con passers showed the fact from the bunk

ars to the furnace door, and the firement toes it in. There is something more Ayer's Sarsaparilla A cure

DOGS ON MONEY. The Canines of Discrent Nations Shown E. Brainel, NW1 of Sec 28 in Tp 2 N of

on Their Coins. There is an important group of about forty coins containing outlines of dogs, which deserve careful study. The in-terest of some of them, says Chambers' Journal, is mainly mythical, as with Lights, the bound of Action, presented to Cephalos by Procris; or with the dog of Segeste, which symbolized the river Crimisus. But there are enough to show how extensive were the operations of

the dog fancier in carly times. The coins afford no evidence of the develop-ment of a spaniel, there being no cs. ample of a pendulous car, or of a mas-tiff, though bulldogs were undoubtedly known in the arenas of imperial Rome But they prove conclusively-what is shown, indeed, by the less artistic products of Egyptian pictography-that the ancients had four kinds of dogs-the wolf dog, the bound, the grayhound and the terrier. The Umbrians had their wolf hounds, the Apulians, of Asculum, their grayhounds, the more rugged hunters of the Tuscan forests their fox dogs. The favorite dog of Artemis Laphria, as on coins of Patro and Sparta, was a grayhound, while Actcon's dogs must have been half-breed deerhounds. Rhegium, if the cours may be trusted, had his sheep doys; the Macedonian city of Mende its terriers, and Cumme, just above the bay of Naples, to which all the luxuries of the ancient of the bactoria of putrefaction. When the curd has become sufficiently firm Further pursuit of this line of inquiry and dry it is allowed to settle on the bot would probably throw some useful light upon the direction of canine do

drawn out in fine threads about onefourth of an inch long the whey is gen-erally ready to be drawn; if the threads re shorter it is allowed to stand until a sati-factory test is obtained. This test is supposed to indicate the amount of

actic acid present. After the whey is drawn from the what is known as sirred curd cheese. in the bustle. the stirred curd process the acid development is carried farther in the whey be

fore it is drawn off, and afters and the curd is kept stirred and the kernels kept apart until salted and put to press. In the Cheddar process after the whey has been drained from the curd the latter is packed on the sides of the vat, leaving a pace in the center for the whey to drain off more readily. After a little time the curd is cut up in pieces convenient to handle and turned over from time to time to allow the whey to drain off more perfectly.

When the curd becomes pretty well freed from whey the pieces are doubled, and the process of doubling is continued at short intervals until the whole forms a compact pile. It is held there until the curd begins to feel mellow and has a stringy, librous texture, when it is put through the card mill to tear it in pieces, so that it can be salted, after which it is put to press. With good milk fine cheese can be made by either plan but taking into account all the changing conditions the cheesemaker must meet 1 have no doubt the Cheddar plan is the safer.

The average amount of milk required to make a pound of cheese is a little over ten pounds. The best apparatus for a small dairy is a small self heating vat-that is, a fire underneath the vat surrounded with water and connected with the water surrounding the vat. For the factory a boiler and steam pipes conaccted with the vat are used .- George A. Smith, Cheese Instructor New York State Dairy Commission.

Artesian wells have been brought into Artenian went have been brought into requisition to supply the milkhouse and have been found just the thing, un-less the digger strikes a flow of sulphur water. DRUNKENNESS, or the LIQUOR HABIT. Cured at Home in Ten Days by Adminis-tering Dr. Haines Golden Specific.

It can be given in a glass of beer, a cap of coffee or tea, or in food, without the anowledge of the patient. It is aneolute-ty narmless, and with effect a permanent and speedy cure, whether the patient i a moderate drinker or an alcoholic wreck. It has been given in thousands of cases. It has been given in themsands of cases, and in every instance a perfect cure b s-followed. It never fails. The system once impregnated with the specific, it becomes an inter impossibility for the inquor appetite to exist. Curves guaran-teed, 48 page book of particulars free.
