INCUBATOR HISTORY.

May be news to you, but the snapping turtle ran the first incubator. Just dug a hole, laid her eggs, covered them with sand, and sunshine did the rest.

Perhaps Pharaoh saw this stunt on the Nile and Confucius on the Yangtze-kiang.

Anyhow, Egypt and China hatched eggs artificially before the rest of the world cut its first tooth.

Why, in 1831 Egypt hatched 25,000,000 eggs a season!

Pretty hard on us Yankee horn tooters who think we're it.

The first incubators were heated with manure, like a hothed, a sure case of "a had beginning makes a good ending," for today they are parlor ornaments, heated with oil, gas and electricity.

Hatching ovens are dug out of ancient ruins built before the Christian era.

Great ovens 150 by 50 feet composed of vaults with a season's capacity of 150,000 eggs are in operation in Egypt today.

Cakes of excrement are burned in troughs over the eggs, and the majority hatch. No thermometers are used, as the attendants become such experts as to tell the degree of heat with their bodies.

No, dear; the Yankee didn't originate the incubator, and he didn't get the first patent on the multiplication table and the alphabet.

They, with a multitude of other wonders, came from lands afar with mystery enshrouded.

Patrons of rural routes have no idea of the annoyance they cause by placing loose coins in the bottom of the boxes. It is estimated that each carrier averages to take up 115 coins each week. They are mostly one cent coins at that and thus prove doubly annoying. The coins are frequently dropped and sometimes lost. In such instances the carrier must make up the differences. We suggest that an arrangement could be made whereby coins might be placed in an envelope addressed to the carrier.

Billy Wheeler, the popular gardener, won't work for his board any more unless he can have Folger's Golden Gate Coffee served to him.
