without a very high rate of speed. Palladine, who compiled twelve books on husbandry, says: A. D. 391, "In the Galilee lowlands they employ a more expeditions mode of reaping, requiring the assistance of a single ox during the whole of harvest time. A cart is constructed which regulating the elevation and depression of the seeth with a lever."

(France) went back to an equality with their less enterprising neighbors. In 1785 a reaper was proposed in Eng-

land; though new tested, this machine, propelled by horse-power, was to clip the heads of grain and deposit them in a box which, when full, could be removed and an empty one substituted. This was probably a complicated machine, as the description speaks of a drive-wheel, pulleys, pinions, tooth-wheels, iron combs or teeth, etc.

Fifteen years later a reaper was put into actual service, which a boy could manage, and with one borse could cut a two feat swath and lay it out of the way of the horse. Next Mr. Gladstone patented what we would now call a self-raker, worked

In 1887 Mr. Plunkett constructed a reaper in which the horse drew the machine instead of pushing it, which up to this time Mr. Nann, of Scotland, invented and work- concludes that the thing is false. He finds There is no better test of permanent prosed a machine that could reap ten acres in no evidence to support the assertion that ten hours with one horse, though if this be Lord Byron was guilty of the incestious perity than to see valuable improvements
