Return and Buy Property

W. J. Humphries has sold his property at the corner of Helman and Oberlin streets, to Mr. Pigney. The Pigney family were former residents of Ashland, but have lived in the northern part of the state for the past few years and are returning to Ashland for the benefit of Mrs. Pigney's health.

Have two very good buys in residence property on Granite street, and on All'son street, at very attractive prices. Ashland Realty Co. 5-1mo

Fruit canning time is at hand. For fruit jars, lids, rubbers, jelly molds and sugar. Detrick's prices can't be beaten.

Medfordites Missing

Today was Medford day, and, although not many of the upper valley folk were in evidence this forenoon, it is expected that there will be a full representation as they promised to reciprocate when Josephine turned out en masse for the Jackson county fair last week, says the Grants Pass Courier. There was a good attendance all morning, and the crowds are increasing daily.

Now is the time to have your piano tuned. Carl H. Loveland Studio, 135 E. Main. Phone 465. 4tf

Fire Threatens Gold Hill

Fire, which started on the Galls creek side of the mountain crawled over the summit of Echo mountain and started down the slope towards this city, says the Gold Hill News. The wind was low and it was late in the afternoon, so little damage was done to the scenic background for the city. Had a strong wind whipped the fire along the face of the mountain, grave consequences might have resulted for Gold Hill. Ranger Pierce and a small crew of men went after the fire Wednesday night, and all but a blazing beacon or two that signaled to watchers through the night, the fire was put out.

Those knowing themselves indebted to me, will please settle their accounts at once, or arrange for their payment. I have gone out of business in Ashland and expect to assign for collection all outstanding accounts October 1. Dr. W. E. Buchanan. 16-5

Ironized Yeast Will Ironize Your Nerves

To Produce Great Natural Nerve Strength, Yeast Should Be Ironized and Not Merely Mixed With Iron. There is Only One Ironized Yeast in the World

Now, Mr. Man, tighten your fist and clamp your jaws. Tighter. Now still tighter. As tight as you can. Notice how weak is the tightest you can go? Vitamins and iron in your body made it possible for you to do these two things. If you had still

Is He Run-Down, Exhausted? See That He Takes Ironized Yeast! more vitamins, ironized, you could tighten your fist and your jaws almost as tight as a vice. Ironized Yeast will enable you to do it, because ironized yeast combines concentrated vitamins with natural organic iron, in such strength that it gives amazing power to nerves and organs in half the usual time. It is the most powerful reconstructive in the world today for tired, exhausted men and women. It is not a mere mixture of yeast and iron, but is yeast ironized, which is a substance all by itself. Give your nerves the natural food-strength they lack. They do not need stimulation, they need natural force. Here it is, Ironized Yeast! This will give you great blood power, great nerve power, an avalanche of energy, brain clearness, stronger muscles, firmer flesh, a clear eye and memory—and you'll smile the smile of health and power. Ironized Yeast is sold at all drug stores, at \$1.00 a package. Each package contains 60 tablets, each tablet is sealed. They never lose their power. M'd by Ironized Yeast Co., Atlanta, Ga. Just try it. It will prove itself.

Finishes Painting House

F. B. Sankey finished painting the house at 102 Oak street, which belongs to the Ashland Hotel company, yesterday evening. Mr. Sankey used his new painting machine to do the work.

Club Sandwiches of Spanish Green Olives

Just the thing for an after-theater lunch, or a picnic party. Olive club sandwiches are easy to prepare, pleasing to the eye, tasty, and very nutritious. The ingredients are usually on hand and the sandwiches may be made up in a few minutes. Toast two slices of bread and remove crusts. Butter lightly and cool, then spread with heavy mayonnaise. On one slice of bread place hearts of lettuce leaves, then spread with stuffed green olives cut in rings. On the other portion of bread, arrange slices of broiled bacon. Garnish with water cress.

PILES

Guaranteed to be Cured Without Operation "CAN I be cured and will I remain cured," is the constant thought of sufferers from Piles. You can be cured and will remain cured under my non-surgical treatment. No knife, no operation, no anaesthetic, no pain, no confinement—and a positive money-back guarantee of cure, no matter how chronic or severe your Piles may be. If you are a sufferer from Piles, Fissure, Fistula or Itching, write to me today.

FARM ADVISER AIDS GROWERS

Hardy W. Campbell, Farm Adviser for the Southern Pacific Company, and grain showing the efficacy of the principles of tillage he advocates. Above, at right, the four heads in the center were grown according to Campbell's plan; the other two by the ordinary method.

Principles of Tillage to Increase Yields Explained by S. P. Farm Adviser.

The same principles of tillage, in preparation of land for crops and subsequent cultivation, which have proven so successful in raising grain crops on Western semi-arid lands without irrigation, are proving successful for crops raised under irrigation and for orchards and vineyards, according to Hardy W. Campbell, Farm Adviser for the Southern Pacific Company. Campbell has inspected this season a number of new orchards and vineyards in California, Oregon, Nevada, Arizona, and New Mexico. Campbell is the man who evolved what is now called the "Campbell System of Dry Farming." Campbell, however, objects to the word "dry" and insists that the principle used in his present plan apply to all kinds of farming, with or without irrigation, as well as under a much lower rainfall than even now is commonly conceded necessary for successful crops. Campbell emphasizes the importance of proper preparation of the seedbed and sufficient intelligent cultivation afterwards.

Campbell arranged to address the Nebraska Bankers Association at Omaha, September 22 on the subject of "Soil Fertility by Utility of Soil Water," and to discuss the same subject before the Minnesota Bankers' Association at Minneapolis. On his return from these conventions he will stop at Yuma, Arizona, to investigate conditions there. Interesting evidence of the direct effect of properly prepared lands was recently received by Campbell from a Metropolis, Nevada, grain field prepared under his direction. In the form of three stools of wheat, one stool had 81 stalks, one 103 and one 120, each the result of one grain of wheat drilled in well prepared soil that was liberally supplied with fertility through well planned and timely work. This crop was raised without irrigation, but was prepared for by summer tillage in 1921 and grown this year.

More evidence of what cultivation of a growing crop means was sent to Campbell by A. B. Shield of Delano, Kern County, California. In four heads of wheat from a stool grown on Shield's ranch. This stool had ample space and was cultivated while growing, no fertilizers or irrigation being used. The stool contained forty-four heads averaging 78 grains each or slightly over 3400 grains from one stool. Such results, says Campbell, simply mean that under certain physical conditions brought about by the right kind of tillage at the proper time, very much more grain, fruit or vegetables may be grown per acre than is commonly obtained. The usual query is "Does it pay?" to which Campbell replies very emphatically in the affirmative.

Campbell recently inspected a number of new orchards and vineyards in the southern and central portions of California to study methods and principles commonly practiced in preparing the land and the after care in irrigation and cultivation. One of these inspections was of a 4000 acre peach orchard of one, two and three-year-old trees belonging to the California Packing Corporation and located east of Merced, Calif. What

Campbell saw here in connection with his general observations shows that the real advantage of careful preparation of the soil before setting is sometimes, but not generally, fully considered and appreciated.

"It is very important to first prepare the surface by leveling," says Campbell. "Then arrange for irrigating in such a manner that water may not only be evenly applied over the whole surface but in as short a time as possible. In other words establish an even surface with reasonably short laterals. Too much water in the soil beneath some trees or too little for others is detrimental usually. Again, the lower places, especially in heavy soils, gather more water, keeping the surface wet longer and frequently delaying timely cultivation, and not infrequently causing the higher spots to lose much of its already short supply. When the trees or vines reach the bearing period, the profit is increased or decreased in both quantity and quality of the crop. Both of these results are governed by the amount of fertility resulting from soil condition in which the per cent of moisture and air carried therein, especially during the warmer weather, is a big factor. The ability to supply this desired moisture in proper quantities the entire season through each year, is the first consideration.

The next question is the perfect root bed. This should be supplied liberally with available plant food evenly distributed, so that when the trees or vines are set, there is a condition so favorable that not only the weaker sets may quickly take root and grow vigorously, but instead of withering and dying, but a healthy, uniform growth may be obtained the first year, which means much to the early and annual fruitage of the trees or vines.

"To achieve this result, after leveling, the field should be cultivated practically an entire season before setting to trees or vines, with only sufficient irrigation to assist in establishing the ideal root bed which should be both fine and fairly firm from the very start. The object is to continually carry the proper quantity of both air and water through the heated part of the season. Under this condition, with the high percentage of moisture held at the top of the firm soil, through careful and timely cultivation, there will be a liberal development and growth of that most desirable soil bacteria. This procedure increases the much needed plant food more evenly in all parts of the field, before setting, than can possibly be developed after setting. This gives an advantage not otherwise obtainable.

"Much can be said of irrigation and cultivation after setting, but to be brief, care should be taken not to over-irrigate, for to obtain the best results, the soil in and about the root zone must be moist but not wet. When the soil is saturated there is practically no healthy growth. As rule cultivation is not only insufficiently frequent but too often is so untimely as to be of little value.

"There are certain conditions of moisture in the soil following irrigation, the same as following a rain, when the high value of cultivation to the final crop is very much greater. These conditions

must be considered. Nothing can prove this more convincingly than the soil auger.

"It is very desirable, so far as possible, to not only carry the high percentage of moisture at the top of the firm soil, immediately below the mulch, but also to induce free access of air throughout the entire growing season. The ideal condition to furnish this is to cover the firm soil with a granular mulch, neither too fine nor too coarse. To obtain this ideal mulch, the cultivation must be done when the soil is moist—not wet or dry. The loosened soil soon dries, leaving the firm soil moist to the top. This is usually easy to obtain in sandy soils, but to do this properly in heavy soils it is sometimes necessary to go over the field a second time, after first going over just enough to loosen the top when the surface is simply dry enough not to stick. This prevents the crusting or drying out. Then the second operation should come one to four days later, after the free water has gone down, leaving the soil moist, when it more readily separates, and makes a finer and much more effective mulch. This procedure means much to the tree, as a higher percentage of moisture is held in the root zone and a crustling and cloddy mulch is prevented.

The high value of this plan of preparation and one season's cultivation before the setting of the trees or vines, is borne out by the interesting results obtained from careful summer tillage for wheat, oats and barley, and the preclusion of time in doing this work is just as vital. There are numerous records of large yields of wheat as high as 40 to 60 bushels per acre, grown on correctly summer tilled land, where nearby fields, prepared and sowed under the more common plan of 'any old way,' yielded very poorly or nothing at all."

The Southern Pacific Land Department Bulletin No. 101 deals quite explicitly with questions of increased fertility by tillage. Bulletin No. 12 also explains in detail the summer tilling question as applied to the coast country. One or both may be obtained without cost by letter or personal application to Hardy W. Campbell, 981 Southern Pacific Building, San Francisco. A Bulletin is now under way dealing with tillage and irrigation of orchards and vineyards.

Campbell's greatest pleasure is to visit a farm or ranch where the proprietor or manager feels he is not getting satisfactory returns and work out, as far as possible, a practical remedy. The Southern Pacific follows the theory that its interests are tied up with the territory it serves, and Campbell and the Company wish to be helpful in increasing agricultural productivity.
