

INSIDE STORY PERTAINING TO JESSE WINBURN

(Continued from page 1)

000. They purchased the Nim Long place for him at a cost of \$6400 and took options on many other places that might seem suitable for the purpose of the organization.

Many months later—possibly a year—Mr. Winburn returned to Ashland. In the meantime word had reached him that he was not being put in to his liking, and he expressed dissatisfaction with his local representatives, Vining, Carter and Briggs. When Winburn arrived he was in a vexed frame of mind. The work of his representatives, he said, did not suit him at all. In a short while he allowed the contract on the Oregon hotel to lapse, and let it go, losing, it is said, his \$10,000. He allowed the option on the Murphy springs to expire and quit at a loss of some \$1000 or more. However, his agents had purchased the Nim Long place outright, paying half the purchase price down, and Mr. Winburn could not take it.

Ignorant of Watershed

Still Mr. Winburn knew nothing about the Ashland watershed. He prepared plans for his cottage, Sap-and-Salt-in-the-Woods, and let the contract for its construction. When the building operations were nearly completed, to his surprise, a great hullabaloo was raised about his contaminating Ashland's water supply.

Upon his arrival in Ashland, it is said, he took Mr. Briggs to task for acting in such a manner as to "get him in bad," and he and Mr. Briggs had a heated controversy over it, and Briggs withdrew as his attorney. Wm. Briggs, of the firm of Briggs & Briggs, was city attorney at the time the water contract was made with the city, and E. D. Briggs of the firm of Briggs & Briggs, was attorney for Mr. Winburn's corporation. Mr. Winburn complained to the Tidings editor that the firm of Briggs & Briggs would essay to represent both sides in a legal contract, and gives that as one of his reasons for dismissing Briggs as his attorney.

Here ends the story that, we think, fixes the lens on the individuals who are responsible for Winburn being in the Ashland canyon with his Sap-and-Salt-in-the-Woods. We think Irving Vining, E. V. Carter and E. D. Briggs evinced little interest in keeping the Ashland water from contamination when they recommended to Winburn the Nim Long cabin as a suitable place to locate his Sap-and-Salt-in-the-Woods, and, as active members of his Ashland corporation, closed the deal for the place for that purpose. In our judgment, if the Ashland water is contaminated by Jesse Winburn, these gentlemen are more to blame than Winburn because they knew that was the Ashland watershed when they recommended it and, as officers of Mr. Winburn's Ashland corporation, closed the deal for the Nim Long place. Give the devil his due.

Politics Enters Story

And how comes the political side of the story. After Mr. Winburn and Mr. Briggs had their "run-in," the city of Ashland, under the guidance of its city attorney, Wm. Briggs, became very active—and exceedingly solicitous on the purity of its water. Mr. Winburn has always claimed that the city administration was under the political domination of E. D. Briggs, as an individual, and as political representative of the Carter interests. He declared war on Briggs and, we think, the powers of the city are now being attempted to be used by E. D. Briggs to "get back" at Winburn. We think that is really the milk in the coconut, and we are utterly opposed to having the city of Ashland used as a catspaw to pull the political chestnuts out of the fire for Briggs, Carter, or anybody else. The administration of the city of Ashland has enough to do to properly conduct the affairs of the town without becoming a party to "fumbling political chestnuts."

The Tidings stands, first and last, for keeping Ashland's domestic water supply absolutely pure. It is one of the greatest assets of the city, but we do object to making that issue "political bunk" with which to prejudice citizens against a newcomer, who has shown every evidence of his interest in the city by making the splendid and unselfish contributions to public enterprises that Mr. Winburn has made, and especially humiliating it to see the mayor of the city allow his political prejudices to lead him so far in his enthusiasm to cast aspersions on Mr. Winburn, in clapping his hands in approval of a bunch of political bunk thrown out by the city attorney purely for prejudicial purposes, to the extent that made it imperative for Judge Gowdy to reprimand him publicly from the bench.

Legal Machinery Started

We have no comment to make on the merits of the case before Judge Gowdy. The legal machinery has been set in motion purposely by Mr. Winburn to settle the question of jurisdiction in the Ashland watershed outside the city. Mr. Winburn claims that Sap-and-Salt-in-the-Woods has been made absolutely sanitary, and that he is being persecuted by the city attorney, and not prosecuted, for political purposes. He says he wants to stop the persecution if he can, and he has chosen to attack the jurisdiction of the city to accomplish that. The courts will determine the case according to the law and the facts.

In the meantime citizens will do well to take the claims of Briggs, Lamkin and Company against Winburn with a grain of salt, and remember that it is likely that they have a greater interest, even, in perpetuating the candidacy of Mr. Blake, who was a member of the council the past year, whose name was suggested by E. D. Briggs as a candidate for mayor in the coming election, and whose petition was circulated by Mayor Lamkin, than they have in the purity of the Ashland water supply. Don't go into a frenzy, dear reader, over the charges made by Briggs, Lamkin and Company against Jesse Winburn, the chances are ten to one that it is political bunk. Instead, let's elect an administration of the city for the next two years which will handle the Ashland water matter in the light of facts and scientific investigation, without prejudice to anybody, and determine the case purely in the interest of Ashland's matchless water supply, and not to cast reflections on persons, or use the issue to "get back" at somebody they don't like.

May Change Location If we do that, and it is clearly shown to Mr. Winburn that his presence in the canyon is a menace to the city, who knows but that Mr. Winburn will donate the Nim Long place to the city as unselfishly and as freely as he has given to the Women's Civic club building, or, in purchasing the Granite City hospital property, as he says he is doing, to be made a present to the town, and find for himself another location for his home in the woods where his presence will not be a menace to Ashland's water supply. Who has the right to question Jesse Winburn's motives in this matter? What has he ever done to justify it? So far, it seems to us, Jesse Winburn has shown a very wholesome interest in Ashland. He has seeds of money, and he appears inclined, as far as we have been able to see, to spend it for the good of the town. Is it not the part of wisdom, then, to encourage Mr. Winburn in his benefactions, rather than to discourage him through persecutions?

It is not the part of wisdom, then, to encourage Mr. Winburn in his benefactions, rather than to discourage him through persecutions?

It is not the part of wisdom, then, to encourage Mr. Winburn in his benefactions, rather than to discourage him through persecutions?

RADIO ANTENNAE OF OTHER TYPES ARE DESCRIBED

Cage, Loop and Umbrella Forms Have Each Certain Advantages and Special Uses.

Some of the newer generation of radio amateurs may have been led to think that the cage antenna is more efficient than other forms. One of the arguments advanced for their use is that they have been adopted by the United States navy on all ships. There is a good reason for the adoption of this type of antenna for the navy, but it is not because of the great efficiency of the cage type. In fact, the only reason the cage type is used at all in the navy is because of the fact that it would be difficult for an enemy shell to carry away the antenna with a single shot.

Some of the newer generation of radio amateurs may have been led to think that the cage antenna is more efficient than other forms.

partly by its inherent characteristics. One of the most important applications of the loop antenna is as a radio compass, for ship, airplane and submarine. By means of the Bellini-Tosi system, in which two single wire antennae, erected at right angles to each other, are used, the exact bearing of a distant transmitter may be determined. This system is the one used by the numerous naval radio compass stations along the coast.

The umbrella-type antenna, as illustrated in Figure 10, receives its name from its general shape and similarity to an umbrella. Referring to the figure it will be seen that this type of antenna consists of a number of wires connected at the upper end of a vertical mast and radiating from that point in several directions. The lead-in is taken from the central point of the antenna system.

In general, length of the radiating wires or "ribs" of the umbrella is about two-thirds the total height of the mast, although this dimension is not fixed, and a different ratio may be employed with success. As can be seen in the illustration, insulators are placed about one-third of the way from the top of the "rib" wires, so that the actual antenna will be some distance above the ground. The over-all length of the "rib" wires, including the guy wire, should be several times as long as the mast is high. This guy wire

can be fastened either to a small post or to a peg driven into the ground. Due to the fact that the wires of the umbrella-type antenna cover a large area of ground, the capacity of the antenna is very large. The total inductance, however, is only a little greater than that of the vertical portion of the antenna.

The umbrella-type antenna has not found a very wide field of application in commercial or amateur telegraphy. During the war it was used to some extent in portable army sets. Due to its directional characteristics, which are nil—or in other words, energy is radiated equally in all directions—it has found some favor with some high-powered commercial stations for trans-oceanic communication.

It has been shown that antennae have certain well defined directional characteristics. The one having the most clearly defined characteristics is the loop antenna shown in Figure 9.

In actual practice a very satisfactory type of loop antenna for reception purposes consists of eight turns of No. 16 wire, spaced one-eighth, and wound on a frame 36 inches square. The fundamental wave length of this antenna is approximately 180 meters. Obviously loop antennae need not be square. They may be triangular, circular, or any closed shape, and their linear dimensions are not necessarily fixed. Due to their small dimensions, the amount of energy picked up by them is also small, and therefore they should be used only with several stages of radio frequency amplification before the detector. See Figure 8, in which the loop is shown with only a detector.

In the hook-up, L is the loop antenna, and forms the inductance in the oscillating circuit. C is the variable condenser connected across the loop terminals and is used to tune the loop to the proper wave length.

A loop antenna in this manner has extremely sharp directional characteristics and receives signals only from stations in the plane of the loop. That is, the loop must be parallel to the direction of travel of the wave sent out by the transmitter.

Many good circuits have recently been devised whereby loop antennae are used with success in eliminating static interference. This elimination is accomplished partly by the small linear dimensions of the loop and

partly by its inherent characteristics. One of the most important applications of the loop antenna is as a radio compass, for ship, airplane and submarine. By means of the Bellini-Tosi system, in which two single wire antennae, erected at right angles to each other, are used, the exact bearing of a distant transmitter may be determined. This system is the one used by the numerous naval radio compass stations along the coast.

The umbrella-type antenna, as illustrated in Figure 10, receives its name from its general shape and similarity to an umbrella. Referring to the figure it will be seen that this type of antenna consists of a number of wires connected at the upper end of a vertical mast and radiating from that point in several directions. The lead-in is taken from the central point of the antenna system.
