

Things to consider before warming up next to your first fire this winter

A warm fire can make even the coldest winter day more enjoyable. Fireplaces may not get much use in spring or summer, but come late fall and throughout the winter, the fireplace can be a great place for families to gather. Before fireplace season hits full swing, homeowners might want to brush up on a few fireplace facts so they can safely enjoy nights spent sitting by the crackling flames. The Chimney Safety Institute of America advises homeowners with fireplaces to hire a CSIA-certified chimney sweep to clean their fireplaces. After a lengthy period of non-use, various issues could be affecting the chimney, many of which might not be noticeable to an untrained eye. Professional, certified chimney sweeps have extensive knowledge of fireplaces, making them valuable resources who can let homeowners know if any safety issues developed since fireplaces were last used. The National Protection Agency recommends that chimneys be swept at least once per year. A full inspection of the chimney might be in order as well. Chimney service technicians will conduct thorough examinations of readily accessible portions of the chimney exterior and interior and accessible portions of the appliance and the chimney connection. The CSIA recommends that homeowners who plan to use their chimneys as they have in the past request a Level 1 inspection, which will examine the soundness of the chimney structure and flue as well as the basic appliance installation and connections. Technicians also will verify if the chimney is free of obstruction and combustible deposits. Homeowners also should inspect their chimney damp-

ers before lighting their first fires of the season. Dampers should open and close smoothly. If not, a service technician can help fix or replace the damper. Firewood is another thing homeowners must consider before lighting their first fires of the season. The CSIA says that well-seasoned firewood works best, noting that wood that is not well-seasoned will produce more smoke than heat. In addition, the home improvement resource This Old House recommends using dense wood that's been split and stored in a high and dry place for at least six months. Oak is an example of dense wood that, when stored properly, can make for an enjoyable fireplace experience. Avoid softwoods like pine. Pine can produce a lot of creosote, which is a byproduct of wood combustion. Creosote is highly flammable, and as it builds up in a chimney, the risk for a chimney fire increases.

FOUNTAIN GUTTERS LLC

*Quality Service & Installation • Repairs
Seamless 5" K-Style • Pre-painted Steel • Colors
Free Estimates • Gutter Protection Systems*

When it can be smart to hire a painting pro

Few things can revitalize a home more readily than a fresh coat of paint. Thanks in part to the affordability of paint and its ease of application, painting is something that even novice DIYers can typically handle. According to the marketing advice guru Brandon Gaille, it is estimated that residential interior paint only lasts around three years before it needs to be updated. Exterior paint can fade, chip and peel due to various environmental factors. As a result, many homes can likely use a fresh coat of paint in at least one room. As DIY-friendly as painting can be, when attempting to paint the interior or exterior of their homes, homeowners may learn that some painting projects are best left to the professionals. Painting requires skill, patience and a knowledge of how various paints — including finishes for particular applications — will hold up. Novice painters may do more harm than good by dripping paint on expensive carpeting or floors or fail to recognize the nuances that indicate a spot-on painting job. Professional painters have spent hours upon hours learning the ropes of what works — and what does not. Painters often understand that painstaking preparatory work is crucial to getting pristine finished results. Walls and ceilings must be properly repaired and prepared even before a base coat is applied.

Professional painters also have an eye for details. And because professional painters make a business out of doing interior and exterior surfaces, they understand which techniques can improve efficiency. That means a professional job can typically be completed much more quickly than a DIY project. Even though some people think they'll save money by painting their own homes, that's not necessarily true. Professionals already have all the equipment necessary, unlike novices who may need to make repeated and potentially costly trips to the hardware store for supplies. Plus, if mistakes happen, DIYers have to spend additional time and money fixing them. Safety can be a large motivator for turning painting over to a pro. Navigating exterior areas or tall interior ceilings can be challenging and may require scaffolding or tall ladders

DIYers do not have. Risk of falls or other injuries increase with lack of experience. Painting can give a home a facelift, and oftentimes it is smart to turn the work over to professionals to ensure the job is done just right.
