Two big piers and two abutment piers are to be put in. Each pier covers over 1000 square feet and is from forty to fifty feet deep, so the excavations take a great deal of time, outside of the actual work of filling in and building the cement piers. The recent successful run of a smelter in Arizona with crude oil as the fuel, demonstrates that the thing can be done. This will be a great saving to many localities where the freight rates on coke or other fuel was prohibitive of a smelter being run in that locality, and will mean the development of camps where the ore was too low grade to stand the expense of shipment to far away smelters.—Mining Reporter.
