Farmerettes Answer Uncle Sam's Call

Girl Volunteers Raise Pigs, Care for Cattle, and Till Soil Better Than Many Men

In the opinion of Uncle Sam the raising of pigs is an important war task; so important, in fact, that he has called upon 200,000 girls and boys to raise porkers for the market. The appeal has been heeded by the farmerettes who are joyfully tackling the job of providing more than their share of the pork products which we must ship to our fighters and the allies in Europe.

This farmerette is having a jolly good time taking care of a litter of eight cute little black pigs. Caring for the pigs is only one part of the work of these Boo-hoo! I'm lost! I'm lost! girls down at their Huntington, Long Island, farm. They are showing that Gentleman-There, there, my girls can be capable farm hands at all sorts of chores. You mustn't give up hope so

Invar, New Metal, Believed By Various Investigators To Have Least Expansion

The fact that all metals expand and readily among breeders. contract more or less with every vacomplications into the making of instandards of time or space, and much research has been devoted to the finding of a metal having the lowest possible coefficient of thermal expansion. particulars. flavored food, both to give flavor and In due course the investigators arrived at a nickel steel alloy containing about 36 per cent nickel and about 5 per cent each of carbon and manganese, which was found to have a remarkably small thermal expansion at ordinary temperatures, and to which the name "Invar" has been given.

A summary of the results obtained during the last 25 years by various investigators of this property of invar and related nickel steels show, according to the Scientific American, that a bar of ordinary invar expands or contracts by about one-millionth of its length for one degree centigrade alteration in the temperature anywhere within the range of zero to 40 degrees. A much higher degree of constancy than this is, however, sometimes obtained; much depends on the amounts of carbons and manganese present.

Small quantities of invar have been manufactured which showed a change in length of less than half a millionth per degree between zero and 20 degrees. This alloy contained .06 per cent. carbon and 9.39 per cent manganese. Samples have even been prepared which showed a negative coefficient of expansion, i. e., which contracted slightly instead of expanding, as the temperature rose.

Invar possesses this peculiar property only within a moderate temperature range; from 40 degrees upward the coefficient of expansion stendily increases as the temperature rises, until at 200 degrees it is the same as that of Bessemer steel.

**************** Cards for the Blind.

he is.

Cards that have recently been devised for the blind have raised letters in the top and bottom corners that reveal their identity. By placing his thumb over the letters the blind man can tell what cards he holds nearly as quickly as the ordinary person, Dots form the letters, "Two D." means that the card is the Two of Diamonds; "J. H." means the Jack of Hearts, and so on. At first the blind experience a little difficulty in reading the cards readily, but they soon become proficient. - Popular Science Monthly.

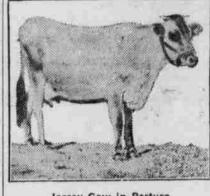

BEST DAIRY CATTLE BREEDS

In Making Selection Dairyman Should Take Local and Market Conditions Into Consideration.

(Prepared by the United States Depart-ment of Agriculture.)

Breeds of dairy cattle differ in both conformation and general characteristics. Each has been developed for certain ends. To make the greatest success a dairyman in selecting a breed should take local conditions and marketing requirements into consideration in connection with the characteristics of the various breeds. He should not allow personal preference to influence his selection if his favorite breed is unsuited to local conditions, but should give careful consideration to the breed or breeds already established in his community. In such a selection he is benefited in many ways.

Jersey Cow in Pasture.

For instance, a market is established, surplus stock may be disposed of to better advantage, co-operative advertising may be used and bulls may be bought co-operatively or exchanged

Jersey cattle, the most numerous riation of temperature introduces great breeds in the United States, originated in the island of Jersey. Jerseys struments concerned with absolute and Guernseys probably had the same foundation stock, but have been developed toward different ideals so that the breeds now differ in a number of

Jerseys vary considerably in color. Shades of fawn, squirrel gray, mouse color and very dark brown are common. Jerseys have a highly organized nervous system and are usually somewhat excitable, responding quickly to good treatment and good feed. Cows average about 900 pounds and bulls 1,500 pounds in weight. The Jersey cow gives rich, yellow-colored milk and is an excellent butterfat producer.

In the Jersey breed, the average of 5,244 cows that had completed yearly eds for the register of merit was 7,792 pounds of milk, testing 5.35 per cent, making 417 pounds of butterfat. The ten highest milk producers ranged from 19,694.8 to 16,633.2 pounds, an average, for these ten, of 17,703.4 pounds of milk. The ten highest butterfat producers range from 999.1 to 875.2 pounds, an average, for these ten, of 943.1 pounds of butterfat.

HINTS ON MILK PRODUCTION

Cows Should Be Kept Clean and Milked in Clean Surroundings Into Covered Pall.

(Prepared by the United States Department of Agriculture.)

After any foodstuff is produced one of the important things is to see that it is put on the market in good shape so that it will keep for a reasonable length of time without loss through spoilage. In this time of need for food every effort should be made to prevent milk from spoiling. Cows should be kept clean and should be milked in clean surroundings into a small-top or covered pail. All utensils which come into contact with the milk should be thoroughly sterilized with steam for at least five minutes, and milk should be cooled promptly to 50 degrees Fahrenhelt or less and maintained at that temperature. Whenever these conditions are met, little milk will be wasted. In this time of terrible destruction of human life it is particularly necessary that milk be produced under such conditions as to insure a safe food for bables. This must be done by a decreasing number of men trained to do it. A great task and a great opportunity for dairymen are involved.

COMFORT FOR YOUNG CALVES

Them Sun-Lighted Quarters, Milk, Sound Grain and Bright Hay-Watch Carefully.

Give the young calf comfortable, sufelighted quarters; whole milk the first two weeks, changing to skim milk thereafter; sound grain and bright hay in liberal quantities as it will use them; and, withal, the watchful eye and the liberal hand of the owner, whose Interest will see that all changes in feed are gradually made.

Poor Roughage for Cows. Timothy hay is quite commonly grown, and is used despite the fact that it is an extremely poor roughage for dairy cows.

THIS WEAK,

Tells How Lydia E. Pinkham's Vegetable Compound Restored Her Health.

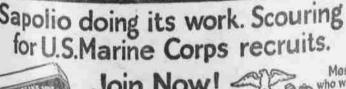

Philadelphia, Pa.-"I was very weak, always tired, my back ached, and I felt

sickly most of the time. I went to a doctor and he said I had nervous indigestion, which added to my weak condition kept me worrying most of the time-and he said if I could not stop that, I could not get well. I heard so muchabout Lydia E. Pinkham's Vegetable Com-

pound my husband wanted me to try it. I took it for a week and felt a little better. I kept it up for three months, and I feel fine and can eat anything now without distress or nervousness."—Mrs. WORTHLINE, 2842 North Taylor St., Philadelphia Pa.

The majority of mothers nowadays overdo, there are so many demands upon their time and strength; the result is invariably a weakened, run-down, nervous condition with headesches, backache, irritability and depression—and soon more serious ailments develop. It is at such periods in life that Lydia E. Pinkham's Vegetable Compound will restore a normal healthy condition, as it did to Mrs. Worthline.
