Why a United States?

In searching for "Whys and Wherefores" isn't it a significant fact that the most prominent people in dairying invariably select the

United States
Cream
Separator

UNITED STATES CREAM SEPARATOR

Can four men lift 800 pounds easier than two men can, and do it oftener?

The U. S. Separator Gears compared with other separator gears are of the "four man" type.

It is the duty of separator gears, no matter what separator, to make the bowl (at the rim point) travel in the average dairy nearly 100 miles a day, 35,000 miles a year—a tremendous work and a tremendous strain. Think of it.

U. S. gears are not only stronger than other separator gears, but being a more medium size (drive gear not too large, pinion gears not too small)

they permit several more teeth to be in "mesh" all the time, thus distributing the strain "among four instead of two."

Specially prepared phosphor bronze is used in the U. S. worm and pinion gears.

All gears are entirely enclosed. Nothing can get to them but the spray of fresh oil automatically supplied, this oil keeping the surfaces from actually touching each other, preventing all wear. The manufacturers of U. S. Cream Separators are originators of the oil splash system.

Don't overlook the importance of superior gears, shafts and bearings. Call at our store.

Ask us for the booklet "Who's Who in Dairyland."
