MAKES MORE MILK KEEPS INDEFINITELY Cost Less Than Most Rations

How to Feed Larowe's Dried Beet Pulp to Dairy Cows.

Dried Beet Pulp may be fed either dry or moistened, and is just as good one way as the other. For an average cow, weighing about a thousand pounds and giving from twenty-five to thirty pounds of milk daily a properly balanced ration may be formed of Dried Beet Pulp and hay—eight to ten pounds of Pulp (Weighed dry) and from eighteen to 20 pounds of good hay for roughage, or as much hay as the cow will clean up thoroughly. Give the Beet Pulp first, dividing this amount into two feedings.

If you have been feeding hay alone, the addition of Dried Beet Pulp will enable you to reduce the quantity of hay nearly one-half, as one pound of the pulp will take the place of one and one-half to two pounds of hay and produce more milk. We do not recommend more than eight to ten pounds of Dried Beet Pulp per day to each cow in any event, and of Molasses-Dried Pulp, not more than five or six pounds per day.

All changes in feeding should be made gradually and in beginning the use of Dried Beet Pulp, start with about two pounds daily, mixing it well with the remainder of the ration, if other grains are fed. After two or three days, another pound per day may be added, and so on until the point is reached where the most economical results in milk production are secured.

For rolled barley, bran and other grains or mill feed you can substitute Dried Beet Pulp pound for pound and obtain better results.
