INEXPENSIVE SHELTER SUITABLE FOR BACK YARD POULTRY FLOCK

Plan of a Simple Backyard Poultry House.

(Prepared by the United States Department of Agriculture.)
Piano and packing boxes can be successfully converted into adequate backyard poultry houses, but many owners of small flocks prefer a building erected especially for the purpose, because it usually presents a better appearance in the back yard. For such, poultry specialists of the United States Department of Agriculture suggest plans for a poultry house of the shed or slope-roof type that will make a small flock comfortable and be neat in appearance.
This building is 8 by 8 feet square, and is 6 feet high in front and 4 feet high in the rear. The house may be made higher with little extra cost and would be more convenient to work in. The ventilator in the rear is not needed in the northern part of the country. The roof is covered with roofing paper. The same material may be used on the sides or if desired the cracks may be covered with wooden strips three inches wide. Such a house is large enough for a flock of 20 hens.
Provide Simple Nests.
Nests must be provided and may be very simple. Any box about 1 foot square and 5 or 6 inches deep is suitable. An ordinary orange box with the partition in the middle serves very well, each box forming two nests. The top is removed, the box laid on its side and a strip 3 to 4 inches wide nailed across the lower front. Nests can be fastened against the walls of the house or set on the floor. It is preferable to fasten them against the walls, as they take too much floor space if set on the floor. One nest should be provided for each four or five hens.

Dry Floor a Necessity.

If the soil is well drained and remains dry no floor need be used in the house. Often a slight dampness can be corrected by filling up the floor several inches above the outside ground with sand, gravel, or dry dirt. Three or four inches of the surface of the floor should be removed and replaced with fresh earth once or twice a year. The run should be spaded up at least once a year. If the ground is so wet or damp that this condition cannot be corrected by filling, it is best to provide a board floor, as this will help to keep the house dry, will allow easier cleaning, and will promote the general health and welfare of the hens. A house with a board floor should be set on posts or blocks, so that it is 5 to 12 inches above the ground. When this space is left the floor will not rot so quickly and rats will not be so likely to take refuge under the house.
The dropping boards and roosts should be placed against the back wall. Here they are out of the way and also are least likely to be reached by drafts. The dropping boards should be about 20 to 30 inches from the floor, depending on the height of the building. This gives space enough under them so that the hens have room to exercise and is not too high for the heavier hens to fly up to. The roosts should be 3 or 4 inches above the dropping boards. If more than a single roost is used, they should be on the same level; otherwise all the hens will try to crowd upon the highest roost. A piece of 2 by 4 or 2 by

MARKETING APPLES

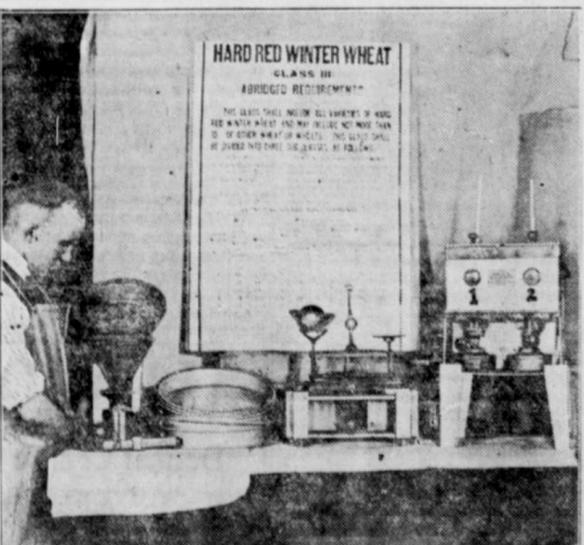

Information secured from apple-market investigations by the United States Department of Agriculture indicate that relatively low prices in large crop years in the beginning of the season make for quick movement and rapid consumption, with the natural result of better season averages; that marketing of inferior grades along with good fruit in large crop years is not profitable; that the effective operation of grade and package laws may be counted upon to aid in stabilizing apple markets.

IMPORTANCE OF APPEARANCE

Potatoes Suitable for Baking Wrapped in Paper and Graded Bring Bigger Profit.

The package in which a product is sold has much to do with its sale. A New York farmer found it profitable to grade and wrap in paper potatoes suitable for baking purposes. He got a better price for them and also some advertisement which sold other produce.

TESTS OF 29,638 SEED SAMPLES

With This Equipment Grain Dealers Can Make All Tests Necessary to Determine Proper Grade of Grain.

During the year ending June 30, 1920, the United States Department of Agriculture tested 29,638 samples of seeds for farmers preliminary to planting. Of these, 16,442 were tested in Washington and 13,196 at the five branches. Under the seed importation act 60,000,000 pounds of seed were permitted entry during the fiscal year, which was more than the total for the previous three years. Nearly 5,000,000 pounds were held at port, more than half of which was reclaimed and the balance ordered destroyed or exported. Red clover and alfalfa crimson clover, rape seed, and alsike were among the leading seeds imported.

Genial Styles Foretell Spring

HATS for between-season wear began selling early this year and there was more than a hint of spring in them. Perhaps their success has been fostered by the fact that Easter comes something like three weeks in advance of the usual date, falling on the twenty-seventh of March, and everyone honors the great festival of spring with a bit of new headwear, at least. But a great deal of credit must be given designers who have taken novel and lovely fabrics and made them up into hats that fit in with whatever fate may send in the way of weather.

Cellophane, slipper straw and visca cloth, all having a highly lustrous surface, with cre and plain satins are featured in hats for early wear. These fabrics are delicate but not fragile-looking and the bright surfaces and fine colors in them make snappy and beautiful millinery. Flowers and ornamented pins, in colors, contribute to the genial styles that foretell spring, and veils are of first importance.

The group of five hats shown above will give a general idea of the styles favored. With one exception, the shapes are small and they include the much-admired off-the-face model and a sailor. The hat at the upper left is covered with visca cloth and ornamented with a fancy braid. Its round crown makes a background for clusters of silk raisins that lie flat against it. Satin and cellophane braid cover the pretty round hat at the right and a ruche of plaited ribbon finishes a beautiful model for early wear. Another cellophane hat appears at the lower left in a small off-the-face shape and one may find it in several rich colors, finished with a silk tassel to match. These cellophane braids are not always one-color—two or several colors used in combination make illustrative and glowing color-play in them. The sailor at the right is made of satin and trimmed with ribbon. The dress hat at the center depends upon satin for its sectional crown and hair-braid for the wide and graceful brim that supports a wreath of flowers.
