Lunar Eclipse Sunday.

The total eclipse of the moon, which is to happen on the evening of July 22d, is an almost central passage of our satellite through our Earth's shadow cone. So complete is the coincidence of the planes representing the apparent orbits of the Sun and Moon when in opposition at this interesting lunar eclipse, that in the *conjunction* immediately preceding and following the phenomenon of the 22d inst. there is a close approach to coincidence of the two planes, and as a consequence we have the two "Partial Solar Eclipses" of July 8th and August 7th, 1888. We know that a total eclipse of the Sun can only happen when, at "*conjunction*," the moon is exactly at one of her nodes; when a similar condition prevails at "*opposition*" we have a total eclipse of the Moon, for under these circumstances the Sun, Earth and Moon are all in the same straight line. When the "node" is reached a little before or after the conjunction or opposition, we may have a partial solar or partial lunar eclipse, as the case may be.

On July 22d the opposition occurs with the Moon exactly at the "node," and the splendid total lunar eclipse of that date, lasting nearly two hours, will be the result.
