

The People's Paper. JACOBS & KILMER, Editors, Publishers and Sole Proprietors. Office in McCall's Hall, upstairs; stairs on north side of Main building. Entered in the Postoffice at Ashland as Second Class matter.

ASHLAND, OR., JULY 25, 1889.

DISEASE AND ELECTRICITY.

Importance of Knowing How to Use It. Health by the Triangle—What Eminent Physicians Have to Say of It—Usual Makers Rheumatism. Although electricity is now recognized as an efficient remedy in the treatment of disease, beyond doubt its proper use is not yet fully understood. Until within a few years its use was practically limited to rheumatism, and a few like morbid conditions. Now the list of affections in which it has proved efficacious is quite long, and is growing longer every year. It is, of course, peculiarly adapted to nervous diseases, and is the most efficient remedy employed, but there are a number of other diseases and derangements of entirely different character, in which it is of great curative value. As, for instance, in the treatment of jaundice and torpidity of the liver it has appeared to us, as well by stimulating the liver, as by its action on the gall bladder, increasing the secretion of bile. Certain cases of jaundice which resisted all other treatment have yielded very readily to this remedy.

Electricity has also been used with marked benefit in dyspepsia, habitual constipation, indigestion, vertigo, vertigo, vertigo, vertigo, and a variety of other complaints. Some physicians have found it of value in baldness, and several have reported it as being of great value in chronic urticaria, in which it has cured a badly ulcerated tongue which had resisted treatment for nine years. Electricity, while an admirable agent in curing all kinds of much in certain diseases, is yet capable of much harm. It is a notorious fact that only a few successful cases are necessary to make any remedy popular among non-professionals, who are exceedingly slow to recognize that it is also possible for the use of certain conditions to do more or less injury.

Electricity as usually taken in disease is now held by people at large to be harmless, and in its administration, yet it is not only to themselves and friends for every conceivable ailment. As naturally expected, in its administration, it is not only to themselves and friends for every conceivable ailment. As naturally expected, in its administration, it is not only to themselves and friends for every conceivable ailment. As naturally expected, in its administration, it is not only to themselves and friends for every conceivable ailment.

Now, to discriminate between them would be the skill of the most accomplished physician. In certain cases, however, the use of several kinds of electricity and such have their special action. One kind might be used in a case and prove a benefit, whereas another, either of the same or of a different kind, might be much aggravated. Beyond all that, it must be understood that in suitable cases, with a proper battery, and a competent operator may do harm simply by wrongly applying the currents.

Dr. Oscar Jennings, a prominent English physician who practices in Paris, has recently written an interesting little work, entitled "Health by Electricity." The doctor himself has had much personal experience in the use of the machine, and beside his own conclusions, he has gathered up the views of those of other writers on the subject. It appears that he is the first to call attention to the medicinal uses of the triboelectric process of the body. He holds that the electric current is carried by the hands, and the current of electricity passes from one to the other of the body. Now, suppose the hands are placed in some part of his body. He puts one hand to the affected spot and holds the other in his hand, or he places elsewhere in contact with his skin. He finds that a few applications made several times precisely in the same way brings him relief, and now he has found that the electric current applied the other pole to the affected spot, very likely instead of being benefited he would be much aggravated.

ROCKS OF THE EARTH.

How They Are Formed—Like All Made by Animals. Granite is the lowest rock in the earth's crust. It is the bed rock of the world. It shows no evidence of animal or vegetable life. It is from two to ten times as hard as the sandstone of the other rocks. It is the parent rock from which all the other rocks of the earth are derived, or indirectly derived.

It is true that it does not contain lime, while limestone does contain that substance, but it is lime in a different form. The lime in limestone is combined with carbonic acid, and is gradually and surely filling up the valleys and "low places" of the earth. Chemical analysis shows that the lime in limestone is combined with carbonic acid, and is gradually and surely filling up the valleys and "low places" of the earth.

The forces of nature are gradually leveling down the mountain hills and are gradually and surely filling up the valleys and "low places" of the earth. Chemical analysis shows that the lime in limestone is combined with carbonic acid, and is gradually and surely filling up the valleys and "low places" of the earth.

Some animals bring out rock changes as active agents. All burrowing animals level down the surface of the earth, and in the process of their work they are gradually and surely filling up the valleys and "low places" of the earth.

ELECTRICITY ON SHIPS.

This New Force Puts a Vast Light Upon the Hands of One Man—Search Lights Manipulated, Guns Fired, Torpedoes Steered and Ships Piloted by Electricity.

Electricity on ships of war is purely an American idea, and was first tried on the United States steamer Trenton in 1838. Some years after the system had been tested the vessel sailed on a three years' cruise, and attracted much attention as the first war vessel so fitted out. Each cruiser has about 100 lights, and the gunboats about 250, with sufficient supplies to last three years. All the cutouts and circuits are made water tight and tested by turning a stream of water on any part of the circuit.

There are innumerable devices by which electricity is made to perform its work. The value of the search light cannot be estimated, as securing parties, torpedo boats or swift steam launches can be detected a mile away on the darkest night. As a motive power for small machines it is invaluable, and in the Chicago will be brought into play for training the huge guns of the main battery. It is used also for discharging the batteries and the entire system under the absolute control of the commander from his position on the bridge. It requires no fuel, and its maintenance is plain in communication with the various departments of the complex machinery. Electrical devices perform all the duties, transfer the orders, and regulate the movements with far greater accuracy and safety than would be possible by the old methods.

The simple pressure of a button sends the huge monster with life and activity, causing 10,000 tons of lead smoothly through the water at a speed of 15 miles an hour. The touch of a second button the great shields swing sideways and huge apertures are disclosed, filled the next instant by powerful rifled launch tubes. The moment of expectancy, as the commander appears through the little slot on a level with the gun, is the most thrilling in the life of a ship.

The long steel steeple darts through space at the rate of 3,000 feet in a second, bow stern and sides all in one. The white smoke of the crash the fabric trembles below the simultaneous explosion of 6,000 pounds of powder, and 12,000 pounds of iron are hurled whizzing through the air like bolts of lightning.

The merest motion of the little polished lever directly in front of the captain brings the powerful search light into action and sends a dazzling beam through the dark void. To the left, the periscopes still and motionless inoperative, appearing, gliding, and silent, though potent and death dealing auxiliary. A slight click is heard, and a puff of white smoke and a jet of water are driven through the water at the rates of thirty miles an hour. An electric bell signals the officer in charge of the gun, and a revolving electric gun comes to play his part and ere the gun has ceased to vibrate, thousands upon thousands of exploding shells are hurled through the air at the rate of 1,000 feet per second.

The latest electric apparatus on board of the Trenton, the engine room telegraph, invented by J. B. Wallis, an Englishman. It has been thoroughly tested in the royal navy, and adopted for the majority of ships. One of the most interesting and novel features of this telegraph is the use of an engine room telegraph, a revolution of the telegraph and a steering telegraph, the principle being the same in each case. The engine room telegraph is a simple and efficient transmitter and reply indicator, included in a case mounted on a pedestal. This instrument has been tested in the royal navy, and adopted for the majority of ships.

WHITE Sulphur Springs Hotel. R. R. STREET, FOOT OF FIRST AVE. Ashland, Oregon. C. W. GANIARD, Prop.

THE NEW MANAGEMENT. Having leased the above house and thoroughly refitted and renovated the same I am now prepared to offer first-class accommodation to the traveling public.

A PERFECT RESPONSIBILITY. The latest electric apparatus on board of the Trenton, the engine room telegraph, invented by J. B. Wallis, an Englishman. It has been thoroughly tested in the royal navy, and adopted for the majority of ships.

Hot and Cold Baths at any time between 7 o'clock a.m. and 10 o'clock p.m. One Bath room reserved for ladies use. (37) HOTOGRAPHS. Mas. M. E. TYLER, Artist.

Corner Main and Granite Streets. PICTURES COPIED AND ENLARGED. Brochures made in all sizes. Call and examine our work. To the Farmers of Jackson Co.

THE undersigned has opened a HARDWARE TRADE CENTRAL POINT. And will keep constantly on hand a full assortment of Hardware, Stoves and tinware.

We Will Not be Undersold. Call and see us before purchasing elsewhere, for we can suit you in price and quality. J. C. SHERIDAN, SOCIETY DIRECTORIES.

TIMBER LAND NOTICE.

NOTICE is hereby given that in compliance with the provisions of the act of Congress of June 3, 1878, entitled "An act for the sale of timber lands in the States of California, Oregon, Nevada, and Washington Territory," John Mull of Woodland county, Yolo, State of California, has this day filed in this office his sworn statement No. 20, in Township No. 40 S, Range No. 5 E, and will offer proof to show that the land sought is more valuable for its timber or stone than for agricultural purposes, and to establish his claim to said land before the Register and Receiver of this office at Roseburg, Oregon, on Monday the 23rd day of September, 1889.
