HANDY ROAD TOOL.

Combination Device For Whipping Dirt Highways into Shape.

We recently visited a model farm, and one of the most attractive features about it was the condition in which the roads, both on the farm and the adjacent highway, were kept by use of the split log drag. This is a matter of real economy, as well as of good looks. A visit to another farm showed a modified device which we had never seen used elsewhere and which is the invention of the owner, says a writer in the Kansas Farmer. It is so effective that a drawing of it is shown herewith. It is really a combination of harrow and split log drag. The harrow teeth are attached in such a manner that they can be let down and the implement used as a harrow only, or the teeth can be raised and the implement used as a drag only. If the teeth are set level with the bottom of the drag it forms an excellent clod

USEFUL IMPLEMENT FOR EARTH ROADS. crusher, and its weight is such that it can be nicely handled with an ordinary farm team. There are certain roads which require a good deal of whipping into shape before they become good dirt roads. This work can be done by a split log drag if time is taken for it. It can be done more readily by the combination implement herewith illustrated, as will be shown on a trial.

As this implement has a value in the field that is equated by that on the road, it may be considered a distinct improvement over both the ordinary split log drag and the harrow. The drawing is sufficiently plain to show the method of construction, and the cost for the iron attachments for holding the teeth need not be great. The teeth, of course, can be set in a wooden frame, though they are less satisfactory so because less readily adjustable. This implement has been used on the farm where it was made for a number of years and has been found equally effective in the field and on the road.
