COLLEGIANS OF COUNTY BANQUET.

College Men From a Score of Institutions Throughout the Country Guests Saturday Night of Bend University Club.

Crook County's first organization of college men, the University Club of Bend, held its first banquet Saturday evening, and as guests it had a large number of former collegians who are now residents of the county. The dinner was served at Taggart's, at 9:30 o'clock, following the Teachers' Institute program.

More than thirty members of the club and their guests sat down at the table. After a bountiful meal had been partaken of, speech-making was in order. The guests included a number of Prineville men, and they all expressed great pleasure at being present and bespoke for the club a successful career. The visitors from the county seat were Prof. R. A. Ford, Prof. E. L. Coe, Prof. J. E. Myers and Prof. H. L. McBain.

After every man present had made a few remarks, J. E. Sawhill led the singers of the crowd in a number of college melodies. Before adjournment the club decided to hold its next banquet on Saturday evening, May 20, when it will have as its guests the four boys who will graduate from the High school.

The University Club was organized for the purpose of bringing together often and keeping alive the fraternal and social spirit among local collegians. The membership at present is confined to men living in Bend and the immediate vicinity, but later it is the purpose of the club to include within its ranks all the men in the county who have attended college.

The following are the officers of the club: W. D. Barnes of Laidlaw, Northwestern University, president; G. S. Young, University of California, vice-president; J. E. Sawhill, Western Reserve, secretary.

The other members of the club are: G. P. Putnam, Harvard; H. C. Ellis, of Michigan and Chicago; E. M. Lara, Cornell; R. V. Poindexter, O.A.C.; O. M. Patterson, Washington State College; Douglas D. Gardner, Missouri; U. C. Coe, Eclectic Med. Institute of Cincinnati; Edw. L. Chittenden, Whitman College; R. G. Gould, California; J. H. Scott, Missouri School of Mines; H. A. Scoggin of Tumalo, O. A. C.; H. J. Overturn, of Oregon and Nebraska; D. M. Davis, Sanford; I. T. Tholstrup, Washington; J. C. F. Harrington, of Iowa; B. Ferrell, Northwestern; F. H. May, Monmouth College; L. D. Wiest, Pennsylvania College; W. W. Faulkner, North Pacific College of Portland; C. S. Benson, of Minnesota; M. S. Lattin, of Michigan; Frank B. Clark, of Michigan; James Herb, of Washington; Jesse L. Sumrall, Washington and Lee; Ward H. Coble, of Kansas; U. N. Hoffman of Millikan, Trinity College, (North Carolina).

### FIGURES MISLEADING

Census Enumerator Says Rosland 30, Not 126, as Reported.

BEND, Ore., April 17, 1911.

To the Editor:

Kindly permit me space in your valuable paper to say a few words in regard to the census report which appeared in last week's issue.

As the figures are rather misleading, I feel it my duty to shed as much light as possible on the subject. In view of the fact that I was subject to a severe penalty for imparting any information in regard to the census, and especially the count, I did not keep track of the figures, so I am not able to say whether the report of 536 for Bend is correct or not, but would state that I was instructed to enumerate Bend according to the town plat at that time, and therefore the report does not include either Lytle or Deschutes.

When we receive the report for these two places (the population of which really belongs to Bend) it will make quite a different showing.

In regard to the count at Rosland, would say that I found less than 30 people and not 126 as reported.

E. A. SMITH,  
Census Enumerator.

### PEACH LEAF CURL.

Causes and Remedies Discussed in Cornell University Bulletin.

Bulletin 276 of the Cornell university agricultural experiment station gives the distribution, cause and control of that common disease known as the peach curl.

No peach seems immune to the disease, and most growers report that the Elberta is the most susceptible to it.

The symptoms are easily recognized. The leaves become not only abnormally swollen, thickened and distorted, but curl and become sickly yellow in color, often tinted with red. After a few weeks these leaves fall from the trees, in severe cases leaving them nearly or quite denuded of foliage and that at a time of the year when the tree can ill afford to lose them. It is true that a new crop of leaves is soon produced, but this effort of nature to repair the loss is a heavy drain on the vitality of the tree. The disease often affects the shoots, causing them to swell and cease growth and even in some cases kills them.

This disease is caused by a fungus that lives as a parasite in the affected parts. It enters the young leaves and shoots very early in the development and opening of the bud in the spring.

Illustration showing the curled leaves upon a young peach tree in late summer as a result of previous winter injury to the bark of the main root just below the collar. This same appearance may be brought about by yellow, borers and severe mechanical injury or girdling.—Photograph From Bulletin New Jersey Agricultural Experiment Station.

For this reason all efforts to control it are most effective if made before the buds begin to swell in the spring.

The important factors in the control of this disease seem to be (1) time of application, (2) thoroughness and (3) the fungicide used. This statement represents also the order of importance of these three factors.

The time of the application is any time within a month before the buds begin to swell and before rain periods, not after.

The test of thorough work is to find no buds on the trees that are entirely covered with an evenly distributed coat of the spray mixture.

The fungicide may be one of several. Repeated experiments have shown that Bordeaux mixture 5-5-50 to 3-4-50 will control peach leaf curl. Lime sulphur, home boiled, or commercial concentrate of almost any brand is also equally effective.

In the orchards where there is San Jose scale it has been found that spraying for the scale with the lime sulphur also controls the peach leaf curl. This result has been verified at the Georgia experiment station, for before winter spraying became necessary to control the San Jose scale, some leaf curl was discovered in the orchards. However, as soon as regular winter spraying was practiced the leaf curl disappeared.

### Poultry Pointers.

Dark pin feathers give a dirty appearance to a dressed carcass.

A hen's appetite bears directly upon her egg production. Exercise gives it zest.

Shift your henyard about every year or two. The chicks will do better and keep healthier.

Two kinds of chickens will do to kill—those that haven't begun to lay and those that have quit.

Let farmers take more interest in exhibiting poultry at the county and state fairs. Pure bred fowls will advertise your farm.

If you wish your hens to lay well next spring it will be advisable to provide range for them. This can be done by planting a winter crop for their benefit.

Turn the poultry into the garden, if possible, during the last fall days. If the ground is plowed let them run over it before seeding. They will destroy quantities of insects.

Sow a small piece of rye or wheat near the poultry house to give your fowls late and early greens. In very stormy weather feed equal parts of corn, wheat, oats and beef meal ground together as a mash.

Teach the boy that it is better to be a man and a farmer than to be a hand or an arm or a wheel in somebody's factory.
