"GOODIES" RE-OPENS

'Corketts," Burned Out, Back Again, More Popular Than Ever.

Corkett's new establishment in the new Davies building was opened on Saturday, a crowd enjoying the many State of Oregon to J. O. Williams, good things to be purchased there, and as well the extremely attractive apearance of the candy and general 'goodles' shop. Burned out about two months ago, the Corketts showed their pluck and their faith in the ess opening here by reopening with the best that is to be had in equipment. Their Bend-made products already have established a name example before mentioned on the same and a market for themselves.

A pretty soda fountain, the latest in candy show cases, natty tables and metropolitan windows, "classy" luncheon and fountain menus and things to eat and drink better than can be found in many cities, make the lambs to go on grain there is no Corkett's a place well worthy of the big patronage it is receiving.

than young sows. Feeds rich to protein are nec-

essary for the brood sow. The young pigs should be out on the pasture as soon as possi-

Affaifa is a great feed for a brood sow in summer and win-

Provide plenty of pure water, sunshine, range and green for-age crops for the growing pigs. Scattering onts on the ground for the little pigs to pick up to a good way to encourage them to quick exercise.

Do not allow newly acquired animals to mix with the herd. Keep them in separate quarters for three or four weeks.

SMALL OR LARGE SHEEP.

An Argument In Favor of Handling the Lighter Breeds.

The question often arises as to which proves itself the more profitable to the breeder and feeder of sheep, a beavy sheep or a small but better quality one, writes W. H. Underwood. Let us, for example, take the Oxford and Hampshire cross as a type of big sheep, It being a favorite cross, and the Shropshire as an example of a smaller and, it may be said with all due respect to the before mentioned cross, a better quality sheep.

It is well known that big sheep are big consumers and consequently cannot be so thick on the land as small sheep can, and, for instance, where 100 breeding ewes of the Oxford-Hampshire type can be kept 140 Shropshires could be run on the same given quantity of land. Then, too, the Shropshire is more prolific than any other short wooled breed, and, whereas one and one-fourth lambs per ewe is considered quite a satisfactory average in the Oxford and Hampshire flocks or the cross between the two above named, one and three-fourths is quite common and one and a half the usual average in Shropshire flocks, so that, taking the given quantity of land, 100 cross Oxford-Hampshires would produce 125 lambs, and the 140 Shropshires in all probability would produce 220, mortality being about the same in both cases And again, when the time comes for comparison between the amount that an Oxford-Hampshire will consume as against the Shropshire. One and onehalf pounds of grain per day is about the average quantity given to the first mentioned sheep, whereas half that allowance is ample and is all that is generally allowed to a Shropshire. Therefore the quantity of grain consumed by the Shropshires, although nearly 100 more, would be considerably less per day than consumed by the Oxford-Hampshires and in five or six months' feeding would amount to a pretty substantial difference.

Also a Shropshire will clip as great a weight of wool as any other short wooled breed and generally realizes more, and when draft owes come to be sold in the autumn those of the Shropshire or more compact type are far better to sell, as appearances often go against the sale of big, unshapely old ewes. The mutton also is of better quality and makes more per pound in the market than any save the South-

TEST YOUR ALFALFA SEED.

A May Be Done Easily and Chesply at Home With Simple Apparatus,

Only one thing on earth will settle the doubt whether alfalfa seed is pure or not, and that is to test the seedthe best seed obtainsble-so that the abor of plowing and drilling may not be wholly lost.

The testing can be done at bome. It takes only a simple apparatus, consisting of two pieces of flannel or blotting paper about six inches square, between which are placed 100 seeds. The placed between two plates, should be kept moist, but not sopping wet. The seeds which have sprouted should be counted every day. At the end of six days the total number of sprouted seeds will represent fairly well the germinating power of the sample. Good sifnifa seed should give a percentage of at least eighty.

Besides the germinating power there is another quality which must be considered in judging a sample. Does it contain a large number of brown seeds? If so, it would be safer not to use it. The brown seed may sprout in the apparatus just as described, but fall entirely to make plants when put in the ground out of doors. Tests at shown this to be true.

Many farmers sow screenings or seed which is a little, better than screenings and try to make up for lack of quality by doubling the quantity. This may do well enough where land is cheap, but there is too much danger anywhere of getting a poor stand and of sowing the land to weeds,-Kanses Industrialist,

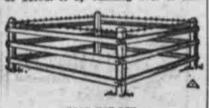

TOO OLD!

Too old to bother with trees, ch? Well, well! Some years ago a Mr. Cobb of Massachusetts set out an orchard when he was seventy years old. He mildly re-marked, when ridiculed, that some one could use the fruit." As a matter of fact, he lived to he 107 years old, so local history affirms, and enjoyed for many years the harvests from those trees.-Farm Journal.

HAY FEEDING PEN.

May Be Used In Supplying Fodder to Stock in the Fields.

A great many farmers turn their stock into fields in the spring and feed them hay from the stack. Often they haul out the bay and throw it on the ground. While the stock may get a good deal of it, they will necessarily trample a lot of it into the ground or so befoul it by running over it that

GOOD HAY PEN. they will refuse to eat it. Here is a good plan for making a hay pen into which the hay may be thrown: Set four posts into the ground, one at each corner of a parallelogram 6 by 8 feet. Nall strong 2 by 4's to these posts every foot from the ground to the height of three feet. Leave a space wide enough for stock to get their bends through easily and nail another 2 by 4 place. This will keep the stock from jumping into the pen. If 2 by 4 places cannot be obtained strong poles secured from the timber and trimmed at ends so they can be nailed may be used instead.-lowa Homestead.

For the Horse's Spre Shoulders. If the horse's shoulders should show signs of becoming sore, the skin being unbroken, a very good application is sulphate of sinc, one-half an ounce; sugar of lead, one-haif an ounce, and water, one quart, and an excellent to tion for bardening the shoulders, even when they have not yet shown any disposition to become sore, is powder ed alum, one ounce; sulpturic acid. one dram, and water, one quart.

Sheep In the Cornfields. One great advantage in keeping sheep in a dry season when the pastures are dried up and closely eaten off is that we can turn the sheep into the corufleids as soon as the corn is well silked out, and this without injury to the corn. The sheep eat any grass and weeds among the corn and also the lower leaves on the cornstalks without detriment to the earing of the

Lime. A limestone soil is a good soil. This proverb states a rule to which the exceptions are so few, if there are any, that they need not be considered. Lime is more generally needed than most of us are aware. Try a few bushels of lime on the fields you are about to sow to clover and see if it makes a better crop.-Farm and Fire-

Before planting any large quantity of smail grain, grass or clover seed send a sample to your state experiment station for examination. The seeds of many noxious plants are to be found in topure and unreliable seeds. It is far easier to do this than to erudicate some pestiferous weed that obtains a firm foothold on

your farm.
