

WHETHER gardening is conduct ed for profit or cise and pleasure. the right thing at the right time. It may be taken for granted that a majority of thos who take up the work desire both profit and pleas

source of failure is sourness of the soil, which is found in some of the places that are almost wholly

shaded during the months which in tervene between the growing seasons and which also lack a free circulation of air. Wood ashes and slaked lime are good for this and are also a most excellent fertilizer. A peck of ashes well mixed with a wagon load of soil is the gardener's rule, but for small beds spade the ground deeply, and after breaking up the lumps and raking thoroughly scatter ashes or lime evenly over the surface until it is as white as after a light snowfall; then rake it well. This should be done be fore planting time or as soon as the d can be worked. It is best to have the plowing done in the fall. Success in the vegetable garden de-

pends largely upon thorough and frequent tillage. The tillage should begin as soon as the plants can be seen and should be repeated at intervals of about one week throughout the season. Much labor will be saved by substituting a wheel hoe for the hand hoe for stirring the soil close about the plants while they are small and by using a horse for cultivating between the rows wherever there is sufficient space. If these methods are employed the most irksome features of vegetable garden-ing—the weeding and tedious hand tiliage-will be eliminated. As soon as the heavy frosts are over

and the ground is tillable we may plant onlons, lettuce, spinach, radishes, bests, parsnips, carrots, parsley and peas. The normal season for planting these crops is when the farmer is sowing his oats.

The warm season crops are subject to injury by frost and cannot safely be planted until the weather is comparatively warm. The different crops in this group, however, differ in re spect to the intensity of heat they re Thus sweet corn, and string beans are usually planted early in May; lima beans, tomatoes, cucumbers, melons and squashes are planted one to two weeks later, while sweet potatoes and eggplants should be kept in the hotbed until the last of May or the first week in June.

Lettuce can be grown successfully on poor soil, but only through the early spring and the late fall, as the ground becomes so hot that it will burn in the head, and then it is ruined for market. On rich land there is always a certain amount of moisture that remains in the soil, and then the evening dews belp to keep the ground cool. Keep the land free from weeds.

grown earliness and tenderness are greatly desired as well as flavor. These qualities will be found where a good supply of nitrogen and phosphoric plant food is available. A suitable fertilizer for these crops is 600 pounds per acre carrying 4 per cent nitrogen. 8 per cent phosphoric acid and 10 per Tomatoes, corn and potatoes enjoy a

medium long season of growth; therefore it is necessary that they have a sufficient supply of the correct food elements to satisfy their requirements throughout their growing season. The market demands a smoothly formed, solid, well colored tomato and juley yet well filled corn. Potato growers of the famous Aroos-

took district of Maine practice a three year rotation of corn, clover and potatoes. By this means it is evident that the organic matter of the soil is maintained. When the potatoes are planted it is the custom to apply as high as 1,500 to 2,000 pounds per acre of a fertilizer analyzing 4 per cent nitrogen, 6 per cent phosphoric acid and 10 per cent potash.

For Cows and Calves. Strong brine thickened with soft son; makes a good mixture to rid cows and

#### A QUESTION OF BREEDING.

Pure bred chickens are all right, but the question is, Shall the farmer make feathers and fancy points of primary or secondary importance? It is not worth while to talk about fancy points unless the farmer can be shown that there is some connection between them and productive qualities. He is not concerned about such things, but he is concerned about supplying the market with poultry and

Eased Her Mind. Simpson-Jones wanted to be-

come a suffragette, but her husband "But," she pleaded, "if you only knew what a lot one learns at their meetings-all about referendums and

"I've said no, and that ends it!" snapped Mr. Simpson-Jones. "If you women want to find things out why don't you follow the advice of St. Paul and ask your husbands? You women and such fools."

This was too much for Mrs. Simpson-Jones' long humbled spirit.
"That's just the trouble," she return-"Women have been 'asking their husbands' for the last 2,000 years, and they're still fools."—New York Tribune.

Investigations which have been carried on of late into the habits of the stable or "horsefly"-the one that bites m to indicate that this particular fly is responsible for the spread of infantile paralysis among human beings and a disease closely resembling this which has been fatal to horses in

# Farm and Garden

TREES AND FARM SUCCESS.

Another Eden Possible. Restore the garden of Eden. Adam and Eve lived easily in the garden because it was full of harvest yielding trees, and the curse that fell upon mat was the fact that he had to grow small stuff like grain and vegetables, the ate bread in the swent of his brow. The man who thinks this possible b Dr. J. Russell Smith, professor of indus try in the Wharton school of flusnee and commerce, University of Pennsylvania, who told 500 of the leading pomologists of the country that the cost of living rests in their hands. He

ed for the university, studying the possibility of a new agriculture. "Trees are the great engines of food production," he said, "and we should at once begin their extensive utilization. Europe and Africa are showing us the way. Portugal has orchards of acorn bearing oak trees that are far miles of Philadelphia. The great trou-ble with the American pomologists is that they are too aristocratic, have been too proud to think about feeding a pig, yet the pig feed problem is one of the big problems of America,

mile journey he has recently complet-

for the pigs eat more than we do.
"There is evidence in both Europe and America to indicate that properly

TREES ARE THE OBEAT ENGINES OF FOOD

selected and propagated oak trees can be made as productive of pig food as is corn and do it much more easily and for a great deal longer time. The suckers that arise from the stumps of two varieties of Pennsylvania oaks have produced good crops at the ages of three and seven years respectively. I have seen acorp orchards bearing well in Spain on rocky slopes so steep that the farmers only permitted the little pigs to go in, because the big ones might fall and break their necks. "The tree offers the best means of utilizing rough and broken lands, also arid lands and in some cases the best of lands. to breed plants we are now ready to develop as food for man or beast dozens of new crops which can easily double our productive area. At pres ent harvest yielding trees cover but one-fiftieth of our productive area. Some of these possible crops are the walnuts, pecans, shagbarks, almonds, olives and dates for human food and the chestnut and persimmon for pigs honey locust bean, the mesquite bean (of the west) and the mulberry and the many varieties of oak for forage."

Appropriation For Hog Cholers. The United States senate has passe bill providing an emergency fund of \$500,000 with which to fight hog choi era, which threatens the country with a pork famine. Senators from the middie western states said that if some thing is not done to stop the ravages extra

gregate \$200,000,000. It was pointed out that at least 90 per cent of the hog deaths in the United States come from cholers. It is the purpose of the department of agriculture, which asked for the passage of the bill, to fight the disease when first it breaks out in any place.

"From a practical standpoint," say experts of the department, "the important thing is to recognize hog cholera as soon as possible. Good serum may be depended upon to protect well hogs and even to cure a large percentage of those in the earliest stages of the disease, but it will not be of much avail when used upon hogs that are already visibly sick."

In mild weather mares must be kept in the open sheds outside, both day and night. Each mare should have a special place where it is tied to receive its grain feed. If fed from an ordinary trough the more vicious mares .may kick the others and gobble most of the feed. Roughage may safely be fed from racks in the yard.

Massaged With Nettles. Nettles are said to be an almost certain proof that man has lived on the spot. One British species, the so called Roman nettie, is said to be found only where the Romans have been. Coles, the seventeenth century herbalist, explains, "It grows both at the town of Lidde, by Homney, and in the streets of the town of Rowney, in Kent, where Julius Caesar landed, with his souldiers, and abode there a certaine time, and for the growing of it in that place it is reported that the souldiers brought some of the seede with them and sowed it there for their use to rub and chafe their limbs when through ex-tream cold they should be stiff and benumbed, being told before they came from home that the climate of Britain was so extream cold it was not to be endured without some friction."

"I have poured every day this week at some function or other." remarked the vivacious girl.

"Well, well!" murmured the old gen tleman who overheard her. "Now I know what is meant by the term 'a reigning belle."—St. Louis Republic.

Bessemer's III Luck. Sir Henry Bessemer was one of those inventors that ill luck pursued and from whose clutches he finally escaped by indomitable perseverance. In 1833 the British government was losing \$500,000 a year by the fraudulent misuse of embossed deed stamps. Besse-mer rendered this impossible by the use of perforated dies which dated the stamps. He presented the invention to the government, which forgot its promise of a permanent appointment, but thanked him. His great invention in Exponent of New Agriculture Believes the manufacture of steel so impres the fronmakers that they paid his \$135,000 for licenses and "wanted their money back." He had forgotten the proportion of fools to wise men. It took him two years to render the proc ess "foolproof," and he pressed his point home by the setting up of his factory in Sheffield.

Turned the Tables. In his reminiscences Henry Holiday tells a story of a Londoner, "Roneo" Coates, who thought he was s born actor. Contes paid a large sum to be allowed to play Romeo at Drury

gave the American Pomological socie-ty some of the results of an 18,000 Lane, where he appeared bedizened with jewels and was received with vociferous applause by a public who appreciated the joke. Some of the young men who were the favored associates of the prince regent concected a practical joke at the expense of Contes They got a sheet of the prince's note paper and sent him an invitation to line at the pavition. The prince got wind of the trick, and when Coates was ushered in and the jokers were ooking to see his discomfiture he turned the tables on them by receiving his visitor with great politeness and

Can't Drink a Bit.

When Young America scents a joke even the Humane society is not im-mune. A few days ago a boy rushed into a police station and demanded to see a Humane officer. He excitedly reported gross cruelty on the part of When he got his breath he explained that the man was watering his horse without removing the bit "And why should he do that?" asked the officer. "Why," said Young Americe, "the horse can't drink a bit."-Indianapolis News.

The first step that should be followed in restoring the fertility of a rupdown farm should be to increase the number of animals kept on the place. Cattle, sheep and hogs are better than ione, but the dairy cow is the best fertility restorer of the lot. Every effort should be made to increase the manurial product of the farm. Another aid is to grow the clovers as group manures. After this a crop should be raised which will require clean cultiration and dispose of the weeds. Clover should be sowed again and plowed under or may be used as a meadow for ne season and then plowed under with a cultivated crop following. As the soil becomes richer the clover crop will not have to be produced so often

## SEXUAL KNOWLEDGE
