## ROV: High school team heads to world event

*Continued from Page 1*

neering, art, math, and problem-solving skills in order to complete the challenges successfully.

One part of the competition is to design and build an underwater robot from scratch, then perform a number of missions in the pool with said robots.

A second part of the competition is to research and write about the three themes, all centered around current global issues. It requires us to put together a marketing poster and a technical document.

The third part of the competition requires us to create a 15-minute engineering presentation that describes everything we've created and present it to engineers who will judge our work. We'll also receive points for media and community outreach, which encourages spreading the word and volunteering in the community.

We have worked hard to volunteer our time to teach the middle school teams about ROVs, electricity, soldering, and running tests to create data for decisions they'll need to make.

This year, the competition theme is the United Nations Decade of the Ocean. Competitors dealt with challenges based on offshore renewable energy systems, Antarctica then and now, the Endurance shipwreck, and blue carbon and aquaculture.

Examples of the challenges include inspecting and repairing holes in a fish net, planting and pruning seagrass, and fixing underwater power cables to offshore windmills.

Challenges in the world championships will take place in the Long Beach Community College pool. In addition, teams must create a technical document for their vehicle, a marketing poster, and an engineering presentation to a panel of judges.
