Hog Influenza May Cause Serious Loss

Prevention Should Be Practiced in Hog Lot

Earthworms, usually found in large numbers around old straw stacks, often contain the lungworm which in turn is the carrier of hog influenza. With the arrival of cold damp weather, swine raisers can look for cases of hog flu.

Proper housing including draft-free ventilation and adequate bed-

A healthy, well-housed and fed hog will not be in danger of contracting flu.

ding are necessary if hog flu is to be controlled or prevented. They should be kept from undue exposure. Hogs need dry, warm quarters free from drafts.

As the disease is contagious, any sick animals should be separated if part of the drove comes down with the flu. Special care and nursing should be given to the brood sows.

By proper housing, feeding and management, little trouble should be met with in the prevention of flu. It is taken for granted that the hog drove has been bred for constitutional vigor. A strong hog well managed will never prove a disease problem.

Chemical Effective

As Weed Eradicator

The chemical 2, 4-D (chemically 2-chlorophenoxyacetic acid), has proven effective in killing dandelions, plantains, and many other weeds with little difficulty or expense by spraying.

Detail work is being conducted at Mississippi state agricultural experiment station by Prof. O. A. Leonard and F. H. Herzer. Prog-

Left, untreated bitterweed; right, bitterweed treated with 2, 4-D. This method of treatment has proven valuable in many ways.

ress report indicates that the chemical acts as a plant hormone. When used in high concentrations, the plant dies under proper conditions.

The USDA reports that a solution of 2, 4-D containing as little as 1½ ounces of the chemical in 10 gallons of water will be deadly to many species of broad-leaved plants including dandelion, plantain, pennywort, Japanese honeysuckle, annual morning-glory, daisy, chickweed, winter cress, ragweed, pigweed, burdock, wild mustard and annual sow thistle.

Agriculture In the News

DDT in Paint

By W. J. Dryden

A wall paint blended with DDT under a new process has proven an effective "insect control" as long as 16 months after a single application. This paint, "Superior 365," contains 200 milligrams of DDT for each square foot of painted surface and has proven effective against 132 varieties of insects.

Tests have shown that seven seconds contact, on DDT paint, for flies first paralyzes and then kills the insects in 30 minutes. The paint is harmless to humans, and is especially effective in milk houses as well as other farm buildings.

Superphosphate Needed

Five to six tons of animal manure reinforced with one-half bag of superphosphate per ton of manure produces as much increase in yield as does 10 to 12 tons per acre without the superphosphate.

The superphosphate can be scattered over the top of the load of manure before it goes to the field. Or it can be applied in the barn or sheds. When used in barns or sheds, it helps to keep down odors as well as reduce nitrogen loss.
