

**New Motor Bus Schedule Made Effective Monday**

The Southern Pacific Motor Transport Co. rearranged their schedule effective last Monday the 8th, giving Halsey two north bound stages and one south. The north bound stages will arrive at 8:42 a. m. and at 12:52 p. m. The southbound stage will arrive at 5:16 p. m. The 12:52 p. m. stage is a de luxe observation bus and is timed to arrive at Portland in time to connect with trains leaving for the North and East.

This change means a great deal to people in this vicinity as it gives them practically all day for business or pleasure at the county seat and other towns to the north. A change in the train service is scheduled for the 22nd of this month but just what the changes will be is not known at present.

10 a. m. Sunday school.  
89 last Sunday. We are proud.  
Come, enjoy it with us. Brother Robertson says he's glad to be with us again.  
11:00 a. m. communion service  
11:15 Christian Endeavor. The boys will lead this time.  
No evening services at all.  
C. Adrian Sias, pastor.

Coolidge catches five little fishes on one of his extended expeditions to the far corner of the 80 acre preserves now his summer home up in Wisconsin and the papers gave the incident front page, top of column along side pure reading matter, naming the bait and tackle used, while at the same time three of our "most wide-awake" citizens slipped out their back doors and in a short time were home again, wet to the skin and many times five fishes tucked in their baskets. Yea, trout.

**Except in Wet Weather Vines Pruned and Tied Do Not Thrive Better.**

Many vegetable growers believe that they can get an earlier crop of better tomatoes if they prune each plant to a single stem and tie it to a stake than if they allow the plants to grow naturally on the ground.

Sometimes this is true, but sometimes it works the opposite way, say vegetable growers at the New York State College of Agriculture at Ithaca, for experiments which they have conducted show that the results depend on the weather during the growing season.

**Early Products Wanted.**  
Growers who supply the general market are more interested in an early product that is uniform and attractive than in a high yield. In a wet season, especially when it is cloudy and wet when the plants blossom and the fruits set, vines that are pruned and trained may produce earlier and yield more. On the other hand, in normal or dry seasons, vines that are pruned and trained produce considerably less marketable tomatoes and the crop is not much earlier. In very dry seasons, the fruits have more sun-bleed and more blossom-end rot if they are pruned and trained than if they are unpruned.

Ordinarily the yields of tomatoes are reduced by increasing the distance between plants in the row. Pruned plants set two feet apart in the row and rows three feet apart produced more than similar plants set two and one-half feet apart in the row, and unpruned plants set three feet apart in rows four feet apart did better than those set four feet apart in the row.

Since pruning and staking greatly increase the cost of growing tomatoes, the returns from each acre and for each bushel must be considerably higher. The higher cost of growing staked tomatoes is due to the larger number of plants needed for each acre, for 2,500 to 3,000 more are needed; the cost of 5,000 to 6,000 stakes; cost of twine for tying; and the cost of labor required to set the stakes and to prune and tie the plants to the stakes.

The additional cost, which usually exceeds \$100 an acre, may be partly offset by the smaller saving in labor in preparing the product for market. Tomatoes grown on unstaked vines come in contact with the soil and often must be wiped to remove the dirt. This, of course, adds to the cost, but it is a small item compared to the increased cost of growing the crop by the pruning and staking method.

**Agricultural Notes**

There is a legume for every season.

Don't blame the seed beans if there is root rot in the soil.

Size and color of fruit have much to do with the value of the crop.

Neither Rome nor a good soil was silt in a day; a start must be made.

**Poisoning Grasshoppers Is Most Excellent Plan**

In sections where grasshoppers are likely to become so numerous as to do considerable damage, steps should be taken to destroy them. They will soon reach maturity and begin laying eggs for next year's brood. They are most numerous along old fence rows or in land that has not been plowed for a year or such a matter.

The poison bait used for grasshoppers is made as follows: With 20 pounds wheat bran thoroughly mix 1 pound paris green. In a separate vessel place 2 gallons water and to this add 2 quarts of blackstrap molasses and 1/2 ounce amyl acetate or banana oil. Then add this liquid to the bran and paris green and the mixture is ready for use.

Scatter the poisoned grain early in the morning when the hoppers are hungry. It may be thrown like one would sow small grain by hand. Scatter the bait thinly, as a small quantity will kill a lot of hoppers.

**Difference of Opinion on Best Silage Corn**

There is a wide difference of opinion as to the best variety of corn for silage. Some prefer a corn that will make a large tonnage, irrespective of time of maturity, while others prefer a variety that will mature early and produce a high percentage of grain. Still others wish their corn principally to develop foliage—planting it thick, so it will produce little or no ears, but much forage. A good many experiments and tests have been conducted along this line, and while there have been some valuable findings, still no definite conclusions have been arrived at.

A dull mower blade, loose guards and loose plates mean poor work, breaks and all manner of delay.

**NOTICE OF APPOINTMENT OF EXECUTRIX.**

Notice is hereby given: That the undersigned has been duly appointed by the County Court of Linn County, Oregon as the Executrix of the Last Will and Testament of W. H. Davis, deceased.
