Administrators or Executor's Notice of Hearing of Final Account.

Notice is hereby given that the final account of Anna May Wilcox, as administratrix of the estate of Henry G. Wilcox, deceased, has been filed in the County Court of Coos County, State of Oregon, and that on the 12th day of December, 1910, at the hour of 10 o'clock a. m., has been duly appointed by such court for the hearing of objections to such final account and that the settlement thereof at the County Court Room in Coquille, Oregon, at which time and place any person interested in such estate may appear and file objections thereto in writing and contest the same.

ANNA MAY WILCOX, Administratrix of the Estate.
G. T. TREADGOLD, Attorney for Administratrix 48-5F

In Justice Court for the Sixth Justice District, Coos County, State of Oregon.

A. E. WHITE, Plaintiff vs. T. W. MEEKS, Defendant } Court Order.
To the Bandon Woolen Mills:

Whereas, the above named plaintiff, A. E. White, has obtained a judgment against the defendant, T. W. Meeks, for the amount of \$34.50 together with costs of the action, which judgment is duly made, entered and docketed in the above entitled court.

Whereas, the Bandon Woolen Mill as guarantisee (in an attachment proceeding instituted in connection with the above action) did make answer which is in file in this court that there was in the hands of said Woolen Mill the amount of Twenty-Two (\$22) Dollars due on and after June 12th, 1910, due and owing and belonging to the said defendant, T. W. Meeks, which said answer is dated May 14th, 1910.

Now this order is authority and the direction of the Court that said amount of \$22.00 be paid into this court, or upon its order or to C. R. Wade, attorney for plaintiff herein.

Dated at Bandon, Oregon, this 22d day of November, 1910.

GEO. P. TOPPING, Justice of the Peace. 54-5F

The RECORDER for Job Work.

THE ARCTIC CROP.

Frigid Yield From Greenland's Icy Mountains.

THE MAKING OF AN ICEBERG.

Hugo Sheets of Ice a Mile Thick In Places Slide Down to the Sea, and as the Ends Become Too Heavy They Break Off and Form Bergs.

At any time of the year ice may be encountered in the Atlantic north of the fortieth parallel of latitude, approximately that of New York, and between 42 and 55 degrees west longitude, but it is in spring, when the increasing warmth of the sun loosens the arctic floes and causes the bergs to melt and float from the places where they have been stranded, that there is the greatest danger to the mariner.

The bergs have their origin almost exclusively in western Greenland, although a few may come around Cape Farewell from the Spitzbergen sea and some from Hudson bay.

A huge sheet of ice a mile thick in places covers the whole of Greenland. This gradually slides down the valley toward the sea, into which it is thrust in great sheets fifty miles wide. As these ends become too heavy they break off and become bergs. The process is known as "calving." The pieces set adrift thus may be a thousand feet out of the water and a mile square, but as they drift about they become broken and continue to diminish in size until they finally disappear completely. The process sometimes takes several years.

Once set adrift icebergs find their way into the Labrador current and begin their journey. But of all bergs so set adrift only a very small proportion ever find their way into the path of the transatlantic steamships.

Nor do all bergs take the same course. Some go south; others lodge against the shore or against islands. Two years may separate the time that two bergs reach a low latitude, though they were "calved" at the same moment.

Field ice also offers an obstruction to the icebergs, though by their great size and bulk they often act as plows and aid materially in breaking up the ice fields which obstruct the arctic basin.

Ice fields are more affected by the wind than are icebergs. Bergs generally drift with the current, so that one sometimes is seen moving into the wind.

Advantage is taken of this by the sealing and fishing boats when caught in an ice field. They often moor to an iceberg and are towed miles through the ice, through which otherwise they could make no headway. This is accomplished by sinking an anchor into the berg and using a strong towline. As the berg advances open water, with small floating ice, is left astern.

But this is indeed a dangerous thing to do. All ice is brittle, but especially icebergs. A blow of an ax has been known to split one, while the report of a gun at times will accomplish the same end. In July and August, when the bergs are breaking up along the coast of Labrador, the noise at times is deafening, and the noise of one often causes another to break up.

From their very nature icebergs assume an endless variety of shapes. Some resemble geometrical figures, while others carry fantastic domes, spires and minarets. Sometimes they appear to be veritable ice bridges, with two separate supports. In many there are great caves and indentations. As they drift south and begin melting cascades of water pour down their sides or run from the tips of the hundreds of icicles which depend from

their sides. Frequently there are rattling noises in the water, as dangerous to ships as submerged reefs. For this reason vessels should always give them a wide berth, half a mile being considered the nearest that one may be approached with safety.

Several years ago the British steamship Nessmore ran into an iceberg and stove in her bows. When she was docked a scratch was found next the keel the full length of the ship, the plates being almost cut through. The ship evidently struck a submerged spur. The government report says:

"It is generally best for ships to go to windward of them, because disintegrated fragments have a tendency to drift to leeward, while open water will be found to windward."

So nicely are icebergs balanced in the water that the slightest melting sometimes will cause the center of gravity to shift, and the entire berg will capsize or founder. Thus many

ships have been wrecked. Field ice is formed throughout the winter within the arctic circle, and as far as Newfoundland, and each year vast flows leave the shores and drift south into the paths of our commerce. The arctic ice often has lived through several seasons in the far north and occasionally is ten to fifteen and sometimes twenty feet thick. Because of its continual motion, due to currents, wind, etc., gradually it becomes broken up. Swells from storms in the open seas cause it to raft or pile one pan on another—in the arctic every piece of field ice is a pan—until it is covered with hummocks.

Ice also becomes rafted by the grinding of a free field against another frozen to the shore or by the grinding of two fields against each other when one is given a turning motion by contrary wind and tide. This rotary motion, it is said, is particularly dangerous to ships that get caught between fields. Chicago Inter Ocean.
