Good Blood

Means good health, and Hood's Sarsaparilla has an unapproached record as a blood-purifler.

It effects its wonderful cures, not imply because it contains sarsaparilla but because it combines the utmost remedial values of more than 20 different ingredients. There is no real substitute for it. If urged to buy any preparation said to be "just as good" you may be sure it is inferior, costs less to make, and yields the dealer a larger profit.

The Modern Fresh-Air Pavilion and What It Accomplishes.

It may be said that to-day the curative treatment of tuberculosis finds itself little departed from the principles of Hippocrates, who 400 years before Christ advised patients to "go into the trol, says the American Review of Reviews. And, although this regimen is filled out by certain measures tending to alleviate and aid, without these four essentials the physician of to-day is able to do little. The international congress on tuberculosis, which meets at Washington this fall, will have nothing beyond to offer. .The single specific for tuberculesis is yet to be found.

Of course, "new cures" are evolved constantly. We have had the "vegetable-juice" cure, the "stuffing" treat-A thousand horse-power tertical gas ment and various "inhalations." But engine, said to be the largest of its kind, one and all prove, upon real trial, to be either worthless or else of only su-

However, it must not be conjectured that the curative treatment of tuberculosis has not advanced. The principles are as ever, but they are being more thoroughly applied and their effectiveness furthered. An unremitting study is being made for a better understanding and appreciation of the fresh air and proper food, the rest, the

careful supervision. Fresh air maintains its position as first among the requirements in the treatment of tuberculosis. That the fresh air may be unimpeded and absolutely incapable of contamination the outdoor pavilion is assuming the perfect type. The tent is losing ground, not even the most radical styles can be fully ventilated at all hours of all sensons with the precision of the modernly constructed pavilion. The tent Now I might I say I am we'l. is hotter than the pavillon, colder than corded precedence over the cottage plan.

BEST FORAGE PLANT.

Washington State Experiment Station Makes Extensive Investigation.

In order to discover a forage plant which will grow and yield profitable crops in the so-called "dry sectiona" of the state, the staff of the State College Experiment Station has carried on extensive investigations at both the local and sub-stations during the past year. Scores of forage plant. have been planted and tested, and at the present stage of this experimentation, it is known that milo maize Jerusalem corn, artichokes, Kaffir corn, and amber cane corn are among the best adapted plants for "dry farming."

The work of the sub-station at Connell has been carried along four lines: First, there has been an effort to determine the best method of handling summer fallow, including a study of the effect of certain tools; second, there has been a study of the adaptability of various well-known dry land forage plants to central Washington conditions; third, a study of the effect of growing a cultivated crop, in place of the summer fallow, upon the wheat crop; fourth, there has been a study of he adaptability and methods of seedng of well-known dry land grasses, nd legumes.

Although the past season has been an exceptionally dry one, and the results could not be expected to show forage crops in as favorable a light as the average season would, yet several plants showed up very promising. Among these were Jerusalem corn, milo maize. Kaffir corn, artichokes and amber cane corn. Another promising one was a small, early maturing variety of dent corn. Other plants tried were cow peas

soy beans, chick pea, common millet. Japanese millet, Hungarian millet golden millet, common field peas kale, rape, poncorn and flint corn. On September 10 the Milo maize showed itself to be the best drouth resister. This plant grows very simi-lar to corn, except that it scatters a great deal more, and is more leafy Jerusalem corn and Kaffir corn are both very similar in appearance to

ommon corn, being about midway etween common corn and Milo maize 1 bushiness. Their seed, however, is orne in a large and fairly compact lead, or bunch on the end of the stalk They yield quite heavily in most places, and judging from this year's experience, would mature a fair quanery useful feed for poultry and wine.

The difference in the showing of lerusalem and Kaffir corn and Milo maize was quite noticeable. While he leaves of the two former plants 'id not dry up the inner plants of the olots were about one-third smaller in ize than the plants on the outer edge This showed that their growth had seen materially checked by the shortge of moisture. The trial leaves

1 Kaffir corn are but poorly adapt to central Washington conditions Dent corn made almost a perfect stand but the growth was scanty, and mly a small quantity of nubbins ma

The present season's growth could not be considered a proved crop, but orn of the same strain grown on land dioining the experiment station last ear was a fair crop, and may be taken s a fairly good demonstration what could be done with dent corn on any good, dry land farm. The ced, however, would have to be depted to the locality.

The flint corn and the popcornade a good stand, and matured well ut their growth was so small that hev could not be given consideration t comparison with dent corn. The nd showed remarkable ability to con inue their growth throughout the en re dry season.

Whether it would pay to utilize oots is an open question. The other ants that were used made so light a rowth this season that further triill be necessary before they can be onsidered as even promising. Of the non-cultivated forage plants

ne most promising was the alfalfa This made a fairly good stand and ontinued to grow slowly throughout he entire season. On September 10 stood about eighteen inches or two eet high. As the first season is needed o establish alfalfa, this is considere n excellent showing. The alfalfa was ceded with a grain drill, which alowed the seed to be conducted down into the shoes of the drill, so that it was deposited in moist soil. It is uestionable whether a good stand ng and harrowing in.

Hairy vetch made a poor stand, but promising growth. The tenacity with which they cling to the soil when once established makes it rather ours tionable whether it would pay to seed rood grain land to vetch, un permanent pasture is desired.

Of the grasses, the most promising was the slender wheat grass; smooth brome grass. Neither of these grasses, however, showed up as well as the alfalfa. Another season's growth is needed to determine anything definite regarding their production. grasses tried were meadow fescue, orchard grass, tall out grass. None of these grasses made a show worthy of mention. Since the past season has been exceptionally dry, they will be given another trial.

The only suggestions the station has to make to farmers regarding these forage crops are that alfalfa, brome grass, acclimated dent corn, Milo maize, Jerusalem corn and Kaffir corn are worthy of trial in a small . The farmer had better learn w to handle them, however, before trying them on a large scale.
