Many Farmers Can Relieve Heavy Demand for Freight Cars.

## **NEEDED FOR WAR SUPPLIES**

In Many States It Is Entirely Practicable to Replace Coal with Wood -Saving Would Amount to 70,000 Cars.

(Prepared by the United States Depart-ment of Agriculture.)
Farmers frequently are situated so they can profitably supply fuel from their woodlands and thus relieve, to a considerable extent, the heavy demand

A maximum price for coal has been fixed by the Government. This does Portland, Or. not mean, however, that the railroads will be able to transport all of the ELECTRIC MOTORS coal which the consumers may desire or want. Every freight car is per-Bought, Sold, Rented and Repaired forming a heavy duty; and the fewer WALKER ELECTRIC WORKS
Burnside, cor. 1/th. Portland, Ore. the cars that are used for coal the greater will be the number available

> city people, because this would result in even greater railroad congestion. Nor is it likely that in either the South or the West the use of wood for fuel can be greatly increased. But in Maine, New Hampshire, Vermont, Mas-sachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania. Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, and Missouri it ought to be entirely practicable in giving a plan for making a section many cases to replace coal with wood harrow says: many cases to replace coal with the four pieces, 2½x3 inches, for fuel. In these 17 states is a rural for fuel. In these 17 states is a rural population of about 20,000,000, which, feet long, marked A; three pieces population of about 20,000,000, which, feet long, marked A; three pieces 2½x3 inches, 3 feet long, marked B; tuting wood, one-quarter of the coal to nearly 3,000,000 tons, or between

Reduce Coal Consumption.

It is where team-hauled wood can e used in place of railroad-hauled coal that the change should be made. Farmers who own woodlands and people in villages who can purchase wood from nearby farms are the ones in the hest position to reduce their consumption of coal. It is not expected substitution of wood for coal will be complete or universal; for many purposes coal is much more convenient. But for heating many kinds of buildings wood is the more convenient and cheaper fuel. This is particularly true in the case of churches, halls, summer cottages, and other buildings for which heat is required only occasionally; but is then wanted in large volume at short notice.

burning wood in 3 or 4 foot lengths. Short lengths, of course, can readily be burned in an ordinary coal furnace or in a box stove, though this is rather wasteful of fuel. Many furnace manufacturers, however, make a special wood grate for use in their furnaces One advantage in burning wood is that n moderately cool days the furnace an be run at a lower ebb than when coal is used, consuming only enough fuel to remove the chill. When wood

If a stove grate is too coarse for wood, a sheet fron cover over a good part of the surface will make it suitable, or a few fire bricks can be used. Relative Heating Value of Wood and

Coal. In the matter of heating value, one tandard cord of well-seasoned hick-ry, oak, beech, birch, hard maple, ash, give the same amount of heat,

One cord of mixed wood well senned equals in heating value at least bituminous conl.

ities, the consumer will, in some nses, have to hurn wood at \$10 or ven \$15 a cord.

he tree growth is comparatively annil, as in second growth, because ich wood splits easily.

Another method, and one better lepted for old growth hardwoods, hich are difficult to split, is to saw of convenient engths, say from 10 to 15 feet. These ire "snaked" out to the edge of the woodland and there sawed and split nto lengths proper for the stove or furnace. The sawing is usually done by machine, driven either by gasoline r by electricity. The wood is sawed nto 16-inch lengths, us is customary with stove material, three runs are coretically equivalent to one cord. Actually they contain somewhat more

more closely than larger ones Wood a Profitable Farm Crop Firewood ought to bring a better profit this year than ever before, on account of the higher prices which are likely to prevail. Wood is a much less perishable crop than many which the farmer raises. When properly piled, the better kinds of wood will last from two to three years, though it stendily deteriorates after the first

New Houston Hotel

Skith and Everett Sks., Portland, Ore.

USE WOOD FOR FUEL

year. To have the best heating value, as well as to reduce the cost of hauling, wood should be thoroughly seasoned, which means alr-drying it from six to eight months. When piled so as to get a good circulation of air, however, 50 per cent of the moisture may be removed in three months. Wood cut in October and November, therefore, may be burned the latter It's

part of the winter. Formerly it was common practice t have wood cut by contract for from \$1 to \$1.50 per cord. With the presen high price of labor, however, the cost may exceed \$2 a cord. The great difficulty in securing farm labor is dur-ing the harvesting period. If farmers can secure sufficient labor to harvest their crops, they should be able to keep enough men to cut and haul wood later in the season. In fact, the profitable employment of one or two extra men on the farm during the winter may help to solve labor difficulties dur-

ing the rush season.

The prices which cordwood will likely bring this year offer an oppor tunity for the farmer to improve his woodland. Improving the woodland means taking out the poorer trees. In ticable, for the inferior wood was not marketable. With wood bringing only from \$4 to \$5 a cord, there is very little opportunity to secure a profit of even \$1 a cord. But with the prices indicated for the coming winter, thin nings become practicable over a wide range of country in the vicinity of good

### MAKING A SECTION HARROW

# DRUGS EXCITE YOUR KIDNEYS, USE SALTS

If your Back hurts or Bladder bothers, drink lots of water.

When your kidneys hurt and your back feels sore, don't get scared and proceed to load your stomach with a lot of drugs that excite the kidneys and irritate the entire urinary tract. Keep your kidneys clean like you keep your bowels clean, by flushing them with a mild, harmless salts which removes the body's urinous waste and stimulates them to their normal activ-ity. The function of the kidneys is to filter the blood. In 24 hours they strain from it 500 grains of acid and waste, so we can readily understand the vital importance of keeping the

the vital importance of keeping the kidneys active.
Drink lots of water—you can't drink too much; also get from any pharmasist about four ounces of Jad Saits; take a tablespoonful in a glass of water before breakfast each morning for a few days and your kidneys will act fine. This famous saits is made from the acid of grapes and lemon juice, combined with lithia, and has been used for generations to clean and stimulate clogged kidneys; also to neutralize the acids in urine so it no longer is a source of irritation, thus ending bladder weakness.

Jad Saits is inexpensive; cannot in-

### Cheerful Open Grate Is Most Inefficient Device Used in Heating a House.

The winter days call attention to the proper use of the grate fire by those who will try to help the country save coal. When the need of using fue economically is as strong as it is now writes Van H. Manning, director of the bureau of mines, department of the interior, we can say, twisting our words a bit, that the proper way to use the grate is to use it not at all. If we look at the open grate as merely a heating device, and know how small a propor-tion of the total heat in the fuel enters the room to be warmed, we must re gard the open grate as probably the most inefficient of all the inefficient devices used in heating a house. The grate fire must not be charged against the heating bill, but to some other ac

ount. Efficiency is always a ratio or frac tion, and is what you get out compared with what you put in. Into the grate one puts fuel that has the ability to produce a large amount of heat, but he useful heat obtained from this fuel is relatively small. Most of the heat in the fuel goes racing up the chimney in company with a large amount of al from the room, this air being replaced by cold air drawn in through cracks and crannies in the windward side of the house. As a device for drawing is cold air a grate is excellent, but it fur nishes much more ventilation than is needed. Mush less fuel, properly burned in a stove, would warm the house better.

### **BACK YARD** POULTRY KEEPING

If the best results are to be expectd from the flock, the hens must no be allowed to become overrun with lice or the house with mites. Usually there will be a place in the yard where the hens can dust themselves in the dry dirt. If such a place is not available, a box large enough (about two feet square) for the hens to get into it should be provided in the house Andrew Carnegie was once asked which he considered to be the most important factor in industry—labor, capital or brains? The canny Scot replied with a merry twinkle in his hens in keeping lice in check and themselves. A dust bath aids the hens in keeping lice in check and therefore adds to their comfort. Usually the lice are not present on the birds in sufficient number to prove particularly harmful. However, it is better to keep the hens as free as possible from this pest, and if they are not able to keep them in check by dusting themselves, other measures

> be treated by placing small pinches of sodium fluorid, a material which can be obtained at most large drug stores, among the feathers next to the skin -one pinch on the head, one on the neck, two on the back, one on the breast, one below the vent, one at the base of the tail, one on either thigh, and one scattered on the underside of each wing when spread. Another method is to use a small quantity of blue ointment, a piece about as lorge as a pea on the skin one inch below the vent. If mercurial ointment is used instead of blue ointment, it should be diluted with an equal quantity of vaseline. Any of these methods will be found very effective in ridding the hens of lice and should be employed whenever the lice become troublesome. Two or three applica

tions a year usually prove sufficient. Mites are more troublesome and more harmful than lice. They do not live upon the birds like the lice, but during the day hide in the cracks and hen's blood, and if allowed to become chors off the captain's buttons, took the paint off the ship's bow and—"

destroyed—will seriously affect her "Stop!" cried the old man. "You the paint off the ship's bow and—" the natural for them to be health, and consequently her ability do me credit, Jack—you do me credit!" to lay eggs. They may be eradicated by a few thorough applications of ker-osene or some of the coal-tar products which are sold for this purpose, or crude petroleum, to the interior of the poultry house. The commercial coaltar products are more expensive but retain their killing power longer, and they may be cheapened by reducing with an equal part of kerosene. Crude petroleum will spray better if thinned with one part of kerosene to four parts of the crude oil. Both the crude petroleum and the coal-tar products often contain foreign particles, so should be strained before attempting to spray. One must be sure that the spray reaches all of the cracks and crevices, giving especial attention to the roosts, dropping boards and nests.
