

Millions and possibly billions of dollars worth of treasures now lying on the ocean floor in sunken ships may be regained to the world by the "cannon ball." The great diving bell has just been completed and is now being tested. It resembles a cannon ball, a giant sphere, eight feet in diameter. The shell is made of tough vanadium steel, one and one-fourth inches in thickness and weighs, with the machinery inside, six tons. The submarine works by maneuvering huge steel pontoons alongside a sunken ship, boiting the pontoons to the vessel and thus releasing the mechanism which pumps the pontoons free of water and raises the sunken ship. The largest pontoons are 40 feet long and 15 feet in diameter, and have a lifting power of 300 tons each.

Two operators form the crew of the diving bell and they work in normal atmospheric conditions because of an oxygen tank on top of the sphere. The air supply will last for 72 hours without being replenished. The supporting cable and all electrical and telephone wires are carried in an insulated cable, which is strong enough to support 56 tons.

Two propellers and a rudder give the ball lateral movement and two propellers send it up and down. These propellers push the ball through the water at two miles per hour.

In front of the ball are four 3,000 candle power nitrogen lamps, covered with a steel net, and a two-inch glass, to light up the hulls of the sunken ships. Near each light is a lookout lens four inches in thickness. On the front are huge magnets, which draw the ball to the hull of the sunken vessel

Business Before Pleasure

Never before did so many Americans spend so much money in Europe, or for such a good purpose.

Silence is usually the best asset of a good-looking woman. Wonder if the cannibals were informed of the dates of meat-

water a state wa Hotter Nearer the Sun Is Made Plain by Scientific Men

Why is the air generally much colder a mile above the earth than near the maid." ground? The heat of the atmosphere comes from the sun, but by a somewhat indirect process. The incoming sunbeams are only slightly absorbed by the dry air at high levels, and so have list't long before her mistress is won-little effect on its atmosphere. In the dering what sort of effect Marie is hav-dering what sort of effect Marie is havlower regions of the atmosphere there ing on friend husband." is always a considerable amount of water vapor (water in the form of gas), and this substance has a relatively large capacity for absorbing heat from sunshine. Lastly, the earth absorbs all the heat that falls upon it, and then gives it back, by radiation or conduction, to the air above it. Thus the atmosphere is mainly heated from below and not from above. Air heated near the ground tends to rise, but it cools rapidly in rising. As it reaches higher levels the pressure upon it is less; it expands, pushing away the surrounding air, and it uses up in this work some of the energy that it originally possessed in the form of heat. This process is referred to by scienticts as "adiabatic cooling." This explains why the heat of summer often seems to come up from the ground, rather than from the boiling sun above. -Popular Science Monthly,

should produce eggs enough, where used economically, for a family of four or five persons throughout the entire year, except during the molting period of the fall and early winter. By the

preservation of surplus eggs produced during the spring and early summer this period of scarcity can be provided for. The keeping of pullets instead of hens also will insure the production of eggs. Not only will the eggs from the home flock materially reduce the cost of living, but the superior freshness and quality of the eggs are in themselves well worth the effort ex-trators. The bulletin continues: mended. Eggs are a highly nutritious "Don't hoard sugar. Buy it just as food and are so widely used as to be almost indispensable, and an occasional chicken dinner is relished by every-

one. Where conditions render it feasible and chenp small flocks of poultry should be kept to a greater extent than at present by families in vil-lages and towns and especially in the suburbs of large cities. The need for suburbs of large cities. The need for this extension of poultry raising is particularly great in those sections where the consumption of poultry products exceeds the production, with the result that prices are high.

Home-Grown Sweet Corn Is **Best-Good Advice** on How **To Grow Your Roasting Ears**

To have sweet corn at its best, says the U. S. department of agriculture, it

should be on the fire within 15 minutes after being pulled from the staik. It loses quality very rapidly after being picked because its sugar changes into picked because its sugar changes into starch. This is a fine argument for having this crop in the home garden, if space will allow. Those who wish to grow their own roasting ears will find the following advice useful:

Corn does best in a fertile soil, but cendiarism is suspected. s able to adapt itself to all textures from sand to clay. To grow it in sufficient quantities for the average famlly requires more space, however, than for most garden vegetables. It should not be planted until after danger of frost is past.

The rows should be spaced not closer than three feet apart, and for the Early Bart, Allen Galgulus, Martin larger-growing late varieties the dis- Amber, \$2.05. Soft white - Palouse tance had best be three and one-half Bluestem, Fortyfold, White Valley, Stalks should be thinned to Gold Coin, White Russian, feet. stand from 15 to 18 inches in the row. White Club - Little Club, Jenkins' In planting, the seed is covered with Club, White Hybrids, Sonora, \$2.01. one or two inches of soil. Cultivation Red Walla-Red Russian, Red Hymust be thorough, frequent, and shal- brids, Jones Fife, Coppei, \$1.98. low

It is possible to use the ground occupied by early corn for a fall planting of such crops as spinach, turnips, and Large, late varieties of corn, kale. however, will occupy the ground for practically the whole season.

Beef for Soldiers' Use Is Under Official Observation From the Pens to Mess Tins

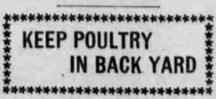

Every precaution to prevent an "embaimed beef" scandal in this war is being taken by the war department, it is announced at Washington.

At present the army consumes about 2,000,000 pounds of fresh beef dailythat is to say about 4,000 head of cattle. And it is under inspection from the time the live stock goes to the slaughter house until it reaches the mess tins of the individual soldiers. It is left to the men themselves to see that nothing happens while the ment is en route from the mess tins to their mouths.

Beginning with the beeves on the hoof, an examination is made for physical defects and all questionable animals are rejected. Then the carcasses are gone over, and only those "sound, healthful and wholesome" are passed.

Fresh meats marked "Inspected and Passed" go forward to the camps in regular shipments, but meats cured, canned or manufactured into sausages, etc., are reinspected at each step of the process.

Fresh meats arriving at the camps are again twice reinspected, first by an inspector of the bureau of animal industry, and second by an officer of that there is a final inspection by the organization commander who draws the ration for immediate use. After chance-to make the food palatable.

The department of agriculture has a campaign in full swing for the establishment of small flocks of poultry in It sort o' keeps us back yards of city or suburban dwell- both interested for ings. In every household, no matter me to think up how economical the housewife, there is a certain amount of table scraps and the provocation kitchen waste which has feeding valne, but which, if not fed, finds its way
