Domestic Wheat Market Better

The strengthening of domestic wheat markets was due in part to continued unfavorable prospects for winter wheat with private trade estimates indicating unusually heavy abandonment and a crop only about three fourths as large as last year's small outturn. Cool weather retarded growth in the Ohio Valley and the condition of the crop varies from fair to good in that area. Weather conditions were favorable in the eastern half of the main Hard Winter wheat belt but large areas in Western Kansas and Nebraska, in Oklahoma and parts of Texas and in Eastern Colo-

rado were still dry with further deterioration reported. Seeding of spring wheat has begun in Southern Minnesota and South Dakota but work over most of the belt was delayed by snows and wet soil. Efforts for large users of flour to accumulate stocks prior to enactment of farm legislation were reflected in a more active demand for wheat and this was an additional strengthening influence in the market.

Commercial hatcheries in the country as a whole produced considerably fewer chicks in January and February than a year ago, with some decrease in the bookings for March and later, according to the hatchery report released by the bureau of agricultural economics. The trend varied a good deal in the different sections of the country.

A decrease in February of approximately 11 per cent occurred in chicks hatched, with bookings down about 5 per cent compared to February 1932. Most of the decrease was in the north central states, according to the report.

In the Pacific coast states hatchings were about 8 per cent less in February than a year ago, but bookings for March and later were nearly 5 percent greater. Some increase in chick production in the mountain states and along the Atlantic coast was indicated.

In commenting on the report, the

market information specialist in the Oregon State college extension service said the decrease in commercial hatchings may be offset more or less by increased farm hatchings, but there is no information to show just what the trend in farm hatchings is. State hatchery reports vary greatly. For example, some sections in California show marked decrease in commercial hatchings, while some Oregon regions where commercial egg production has been emphasized, report that the hatcheries there dealing in high grade chicks are running to capacity this year with orders booked ahead.

Crested Wheat Grass Good

"The forage finds of the century," is the term used to describe Ladak Alfalfa and Crested Wheat grass by E. R. Jackman, extension specialist in farm crops at Oregon State college. These crops have now been tried out for enough years in Oregon to establish their unusual value.

"One can safely use superlatives in describing both of these crops," says Jackman. "Ladak is the longest lived, the most drought resistant, the most frost resistant, the leafiest, the hardest and the highest yielding alfalfa for all the high elevation short water regions of the United States. It is also highly resistant to bacterial wilt which has completely demoralized alfalfa growing in many sections."

Again superlatively, Crested Wheat grass is the most drought resistant, the most frost resistant, the earliest starting, latest staying and best all around dry land grass for the same general region. Old time stockmen speak almost in reverence of the old bunch grass of the Oregon ranges. Crested Wheat grass in many respects is superior to the native bunch grass."

Jackman says that both these forage finds may be credited to the foreign plant exploration work of the United States department of agriculture, as they were obtained in the far corners of the earth, brought back to this county to be tried out at the state experiment stations, and since then introduced by the extension service.

Ladak alfalfa was found in the province of Ladak in northern India where the plateaus are 11,000 to 15,000 feet above sea level and the average rainfall is 2.7 inches yearly. Sudden temperatures are the rule and not the exception. Crested Wheat grass also came from a desolate corner of Asia beside which the dry ranges of Eastern Oregon are probably fertile meadows in contrast.

Crested Wheat grass not only equals the old bunch grass in every way, but excels it in that it reseeds itself freely, says Jackman. Even seedlings attacked by drought can go dormant and return to a growing condition when rains come. In tests in every Eastern Oregon county it has already proved its worth.
