VITAMINS PRESERVE FOOD.

Vitamins, the wonder workers in human nutrition, are now taking on new roles in food preservation.

One of these, Vitamin K5, needed by the human body to help stop bleeding, can extend the storage life of a wide range of foods. OSC food technologists have found.

Small amounts of Vitamin K5 added to mushroom sauce, crab meat, cottage cheese, frankfurters table syrup and strawberry jam greatly delayed spoilage.

Use of natural food additives as preservatives increases food value and prolongs shelf life, according to Dr. H. Y. Yank, food technologist and author of a recent article in food technology magazine. Some chemicals unauthorized as food preservatives may be harmful to the consumer or affect food quality, he says.

Vitamin K5 shows definite promise in preserving fruit made with artificial sweeteners. Sugar, when added to fruits, acts as a preservative and helps prevent molds. But low calorie sugarless fruits spoil quickly unless refrigerated. Vitamin K5 would also be useful in helping prevent food spoilage in unused portions of food. Scientists are also seeking new ways to preserve foods in areas of the world without refrigeration.

How Vitamin K5 prevents spoilage is not known, says Yang. However, some scientists believe that the vitamin when combined with water produces an "intermediate" compound that kills the spoilage microorganisms.

Natural foods high in Vitamin K5 include spinach, kale, egg yolk liver, cheese and tomatoes. Alfalfa is another high source of the vitamin. A light tan powder, the Vitamin K5 in OSC tests was mixed with water and added to foods in varying amounts. Then foods were stored.
