As a rule horses are soft in the spring, and when put at the heavy spring work persepire a great deal more than would be the case if kept regularly at work during the winter months. As the hair is long the moisture is held in it and dirt accumulates much faster than if the horse was covered with a short coat. This condition has led to the practice in some communities of clipping farm horses before putting them at the heavy work, and the general opinion of those who have to do with such horses, both in work and maintenance of their health, seems to favor the practice of clipping.
