Raising 15,000 Snails

Is Unusual Occupation

PEAR RIVER, N.Y.—If ever there is a contest to select persons with the most unusual occupation, Ann Greening and Fred Linderman will be strong contenders for the title. They are snail farmers.

The snail "farm" is not a small operation. It is a large one. They are responsible for 15,000 of these members of the mollusk family.

Their snail "crops" are used in scientific research.

SPORTSMAN'S HORIZON

By JIM RHODY

Beware Poor Land

Experience has taught the veteran quail hunter, regardless of the lack of thought he may have given the matter, to go along with Louis Bromfield's observation, "Poor land produces poor crops, poor stock, and poor people," might well be amended to include "poor game." Given the opportunity he will, almost instinctively, select as his hunting territory a fertile farm, offering ample food and a diversity of game habitat.

We believe it was Dr. R. W. Eschmeyer, the noted fish biologist, who jokingly said the way to spot a farm pond that is full of fish is to notice how well the farm-houses and barns are painted. The better the paint job, the better the fishing. His reasoning was that if the buildings are well maintained, it is because the farmer is prosperous. If the farmer is prosperous, it is because his land is fertile. If the land is fertile, the pond also will be fertile, and the fertile pond will support the most fish. We can't report on how his theory works out in practice, but it sounds logical.

Weeds Not Enough

It is self-evident that non-fertile land cannot produce the luxuriant growths and abundant food supply requisite for carrying a large quantity of game through the critical winter and breeding seasons. Poor land, especially if it has been overgrazed, is highly productive of weeds, but weeds alone are not enough to satisfy fully the needs of game birds and animals. They are fine for mice, but who wants to go mouse hunting?

Less self-evident is the fact that foods grown on neglected worn-out land are deficient in minerals and vitamins that are as important to animals as they are to man. Their degree of importance is indicated by the fact that some animals can detect their presence, or note their absence, in the food they eat. For instance, a hog given free choice will eat from a pile of corn raised from good soil in preference to an equally sized pile raised on a poor farm. Of further importance is the possibility that living in poor habitat and under general adverse conditions alters breeding habits and reduces the reproductive capacity of animals. Leopold suspected this; later observations lend credence to his suspicions. Quite possibly the two phenomena are related.

About Predators

Predator control may help to protect our small game but if we concentrate our attention on killing the predators we should not overlook the fact that our quail or grouse may be suffering most from lack of proper food or cover—the biologist might say that the habitat is inadequate.

Such measures as bounties, artificial propagation, closed seasons, game sanctuaries have not provided the answers to proper management of our game and fish, though they may continue to be useful tools of the wildlife manager for special situations. Any useful tool for land or wildlife management should not be overlooked, nor should the hunting and trapping of foxes and other predators by farmers and others be discouraged where overpopulations exist. The problem is a big one and all interested people can do their part.

Nearly everyone who enjoys getting out-of-doors has the urge to do something for the wildlife. Some feed songbirds, some attend conservation classes or help with projects, others belong to sportsmen's clubs, while many find their biggest thrills in listening to barbershop stories. Nevertheless, the interest is there. When we are interested and enthused we want action and it is human nature to act upon the obvious first. Too often, we tackle the symptoms rather than the disease, and in our haste, we are too hasty to realize, or admit, that man himself is often responsible for his own misfortune on this earth.

Spoon Hooks

When using a spoon hook as a casting lure it is well to set one not too large as the air and water resistance hampers accurate and easy casting, and retrieving is difficult. Spoon sizes 3 to 5 are generally fine for pickerel and northern pike, or large wall-eyed pike. The spoon for muskellunge should be 7 or 8. Larger sizes are better adapted for trolling. A line that is too tight will cause additional twisting, so it is well to employ a line of from 18 pound to 20 pound test when casting.

Changing Plugs

This tip is particularly for bass fishermen who like to angle for these wary fellows after dark. Make a double loop in the end of your line about six inches long and then tie another knot in the end of the loop so as to leave a small loop about a quarter inch long. To attach the plug, pass the small loop through the eye of the plug, then lift the large loop over the plug and pull tight. To remove the plug merely pull the small loop.

Chairs, Table Are Simple Home Projects

CHAIR—PATTERN 348
FOLDING TABLE—PATTERN 349
CEMENT FLAGSTONES—PATTERN 229

THESE comfortable, light and graceful chairs and the folding table are simple projects for the home carpenter. Pattern 348 for chairs and 349 for the table give actual-size cutting guides. Pattern 229 shows every step for making cement flagstones. Patterns are 25c each.

WORKSHOP PATTERN SERVICE
Drawer 19
Bedford Hills, New York

NOW YOU TOO CAN HAVE THE

PORTABLE "CLOCHE" GREENHOUSE

Made of top quality horticultural glass.

1952 Introductory Offer

Complete set

Size 20"x15"

Ready to assemble

19.50

1 You can advance crop maturity from 30 to 60 days.

2 You can plant earlier with full protection from late frost.

3 You can grow crops year around.

4 Easily assembled or stored away.

5 The perfect answer for novice, amateur or commercial grower.

Pickles

Pickles preserved in brine are susceptible to spoilage. Use about one teaspoon of oil poured on the surface after the jar is opened to prevent the growth of mold.

"Miracle Drug" say SURIN Users

Pains of Arthritis, Rheumatism, Neuritis, Lumbago, Bursitis.

Relief Can Start In Minutes

There's no internal dosing with SURIN. Nothing to swallow and wait anxiously for relief. You simply apply SURIN right at the point of pain and blessed relief starts as penetration beneath the skin gets under way. Of course there's a reason for this wonder-working new external fast pain relief medicine.

It's methacholine, a recent chemical born of research in a great laboratory. It acts speedily to aid penetration of SURIN's pain-quelling ingredients. Methacholine also causes deeper, longer-lasting pain relief and increased speed-up of local blood supply.

Tested on chronic rheumatism in large university hospital it brought fast relief to 73% of patients and in home-for-the-aged 77%. Totally different from old-fashioned rubs and liniments, modern SURIN brings faster relief, longer without burning or blistering; without unpleasant odor or grease. Simply smooth on SURIN at the point of pain and feel pain ease in minutes. Money-back at your drug store if SURIN doesn't relieve muscle pain faster and better than anything you've ever used. A generous jar costs \$1.25. *SURIN is not a cure for any of these conditions.
