SOUTHERN CALIFORNIA.

Notable among the pleasures afforded by the Shasta Route is the winter trip to Southern California and Arizona.
Reviewed acquaintance with this section will ever develop fresh points of interest and added sources of enjoyment, under its sunny skies, in the variety of its industries, in its prolific vegetation and among its numberless resorts of mountain, shore, valley and plain.
The two daily Shasta trains from Portland to California have been recently equipped with the most approved pattern of standard and tourist sleeping cars, but the low rates of fare will still continue in effect.
Illustrated guides to the winter resorts of California and Arizona may be had on application to

A Brake That Works.

The public is indebted to The Daily Mail, of London, for introducing, through its Geneva correspondent, an engineer, who is credited with an invention of a "mechanical brake" which stops a train that is running at 50 miles an hour within a distance of 20 yards. Good! But what about the passengers? A train running at the rate of 50 miles an hour covers 73 1/2 feet in a second; and to stop a train moving at this speed in 20 yards means that it must be brought to a full stop in 4.5 of a second. When we remember that, in an end-on collision, it takes several seconds for the momentum of the train to expend itself in telescoping car into car, one is moved to ask what would be the condition of the living contents of a passenger car that was brought to a stop in a fraction of the time that it takes to bring the first car of a telescoping train to rest?
