MODERN WAR WEAPONS.

Marvellous Possibilities of the Inventions Made by Lieutenant Graydon.

There appears to be every indication that within the next five years enormous strides will be made by the United States towards securing adequate protection against foreign invasion.

This protection will not be accomplished, in all probability, by the old obsolete system of fortifications which were sufficient for other days and generations in the early part of the present century.

Instead of them, the United States will probably be armed with weapons of defensive warfare so powerful in their destructive capacity as to convince the would-be invader that his armadas may be blown out of the water and totally annihilated before he can fire his first gun.

THE PERFUMER'S ART.

Two Processes by Which Colors Are Made from Flowers—A Chemical Process.

There are two chief processes by which colors are extracted and retained. One is by distillation, or what is called maceration, the essential oil or essence in which the perfume is dissolved.

This is not all, however. The perfume is dissolved in the essential oil, and the oil is dissolved in the perfume. This process is called maceration, and it is the most delicate and expensive of all.

The second process is by distillation. The flowers are placed in a still, and steam is passed through them. The steam carries off the perfume, which is then condensed and collected.

This process is called distillation, and it is the most common of all. It is also the most delicate and expensive of all, because the perfume is so easily lost.

The third process is by extraction. The flowers are placed in a solvent, and the solvent is then evaporated. The perfume is left behind.

This process is called extraction, and it is the most common of all. It is also the most delicate and expensive of all, because the perfume is so easily lost.

The fourth process is by distillation. The flowers are placed in a still, and steam is passed through them. The steam carries off the perfume, which is then condensed and collected.

This process is called distillation, and it is the most common of all. It is also the most delicate and expensive of all, because the perfume is so easily lost.
