The Motor Car Industry

E VERY few days something happens, and the small studebaker and Buick to call the attention of the third. to call the attention of the think-

Since that time thousands of engineers the present year. the world over have devoted their time and intellect to the building and perfeeting of motor cars, trucks and tractors so that now almost every man, woman or child knows something about the gasoline driven vehicle.

Automobiles and trucks, to say nothing of motorcycles, have become so common on the streets and roads that was this that built the bicycle, then they have ceased to attract any par the safety and then the automobile, ticular attention. But even with all but after the automobile had been methis there are few people who realize chanically perfected the tendency in to what an extent this industry has price was up instead of down, so that already grown.

As near as figures can be gathered according to the leading motor magazines whose authority is not questioned, there is in present use practically a million and a half automobiles and the amount of money invested in this enormous number of machines could hardly be estimated. Probably fifteen hundred dollars as an average first cost would be low, but this amount totals more than the entire production of gold since Columbus discovered America.

The Automobile Trade Journal in a recent issue, makes an estimate in it's ment that there are already nearly editorial column that the amount of thirty factories in the East, all of them money spent this year, 1914, for pleas-ure machines alone, will be six hun-want, and one of the latest in the first dred and ninety million dollars, and this takes no account of trucks or tractors. This is almost seven dollars per capita for every man, woman and child under the American flag. It is surely a wonderful business to be built up in practically ten years.

The same authority goes on to state that at least one hundred and fifty million dollars of this enormous sum is being expended this year for light, cheap cars, of the class represented by the Ford, and it is interesting in this connection to follow out the reason for this great demand for cheap cars. Primarily the small light car is not a pleasure car, for while there are thousands of them sold for that purpose, they are rather an all purpose car designed for business uses and utilized. for pleasure incidentally. The cheap, light cars like the Ford, Metz, Hup

have built up their business because ing men to the tremendous growth of the motor car industry. Fifteen years ago an automobile was a toy. the Ford, which was the first cheap Ten years ago it had been so far per- automobile made that was a real autofected that far-seeing business men mobile. The result has been that they had become interested in the business, are expecting to turn out 300,000 cars

This movement, or the development of this industry, is along the lines of evolution. All business is built up in response to a demand, otherwise it would not be a staple business. Probably no one thing has caused as much study and thought as the question of rapid individual transportation. It the poor man or woman was little better off than before until the cheap automobile came into use. This is the feature that creates the demand for a still cheaper car and that will build up the cycle car industry even faster, in the opinion of most authorities, than the automobile business itself has been built up. The cycle car business will in no way affect the general auto mobile business-it is a new branch of the industry.

The fact that there is a demand, and an enormous demand for cycle cars, is fully borne out by the statefour months has sold 6,000 cars. These little cars sell in the East at \$350, and up until the establishment of the Elbert Motor Car Company in Seattle there have been no factories on the Pacific Coast. The new company is building a car that sells for \$295, and is receiving inquiries for cars and for agencies from such widespread sources and of such a character that they are firm in the belief that they are going to be offered a tremendous volume of business.

The geographical position should give the local factory first call on the business of the far East, much of which has heretofore been handled in Europe. and much of which is new business. Naturally the European manufacturers are at the present time unable to deliver the goods, and there are very few of them that manufacture narrow tread cars.

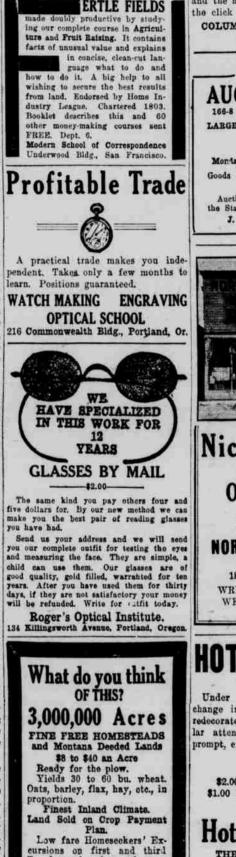

The narrow tread car seems to be absolutely essential for the Chinese and Japanese trade, principally because they must follow narrow trails. The car must be cheap in first cost, low in upkeep, simple in construction and have sufficient power to go anywhere there is a fair road.

There does not seem to be any limit to the business that can be built up by a factory on this coast. Many authorities are firm in the belief that the light car business will within five years equal the present volume of the entire industry.

This does not seem unreasonable when we take into consideration the fact that there are over 100,000,000 people under the American flag. Certainly not all of them could own even a cheap automobile, but that many

One excellent exercise for bringing into play unused muscles is that of steadying oneself by holding lightly to the back of the chair and then kicking, not exceedingly high, eight times with each leg-twice to each side. It is said, too, that besides exercising unused muscles this exercise frees and stimulates the large nerves of the lower portion of the spinal column, and this, of course, makes for health. This exercise may be repeated every day or every other day to advantage.

Lewis Audible Speed Indicator

A simple contri-vance which at-taches to the crank handle of any separator and is adjusted to the required speed. Until the right speed is reached an alarm bell rings; when the right speed is attained, the bell

stops ring, but there is a clearly audible click to be heard with each revolution. When the proper speed is passed and the machine is turned too rapidly, the click ceases.
