LIKE all other living things, trees have a youth, a maturity, and an old age.

Forest trees which give us our lumber, our pulpwood, plywood, and countless other daily necessities, produce most useful wood in their early and middle life.

Good forestry and good management calls for harvesting mature trees before decay sets in and makes them less valuable to the nation, creating a breeding place for destructive insects and disease.

Good forest management creates a cycle of continuous tree crops. That is the basis on which this company operates with an eye on today . . . an eye on tomorrow.
