crop. Then following up in from thirty to forty-five days later or at least before turning out on the range. A third spraying is helpful if it can be worked into the schedule.

What to use as a spray? There is only one spray to use and incidentally, only one time to spray, when the grubs are in the back just before emerging. 5% rotenone mixed at the rate of 7½ pounds per 100 gallons of water, sprayed on the backs with a pressure of at least 200 pounds is effective. It will take approximately three-fourths gallon of spray for each mature animal, slightly less for younger animals. Where only a few head of cattle are kept, such as the family milk cows, 5% rotenone can be applied as a dust, rubbing it thoroughly into the hair on the back. This method will take 3 to 4 ounces of dust per cow.

For those livestockmen who have been asking when the new livestock brand books will be out, a letter from the State Department of Agriculture informs us that the printers have the proof run and it looks as if they will be ready to begin mailing within a short time. It will be necessary to order these books from the State Department of Agriculture, Salem, Oregon if you wish a copy.

As springtime nears a suggestion to farm and townspeople with home orchards is timely. It is time to prune your orchard trees. Pruning is not difficult and it will pay. Just follow a few simple rules.

Usually old home orchard trees are too thick in their tops. Thin out some of this brush. Limbs to cut are those about the size of your thumb; take out the weak, leave the strong. Do this throughout the tree top. Thinning out thick top branches follows the same principles as thinning a row of garden peas—you get better fruit.

Water sprouts that are growing up through the tree center should also be removed. If the water sprout is on a major limb, and a limb is broken away or there is an open space, leave it for a fruiting branch.

The amount of brush to remove in neglected trees may run high as one-fourth to one-third of all branches of the size mentioned.

Usually it is not necessary to cut branch tips; in fact, it is generally bad practice except with peaches. Even with peaches do not attempt to cut back all the branches. Rather, the part to be cut is the main branch terminal.

Still confused? Circular 425 "Pruning Suggestions for Fruit Trees" available at this office should help to explain further details.

Where available water is scant, it will go further if applied through a sprinkler irrigation system, authors of a new north-west cooperative extension pub-

**Traffic Fatalities
Higher Near Dark**

When it starts to get dark, it's time to drive and walk as if your life depended upon it, concludes the secretary of state's traffic safety division after a look at Oregon traffic accident records covering the first six months of last year.

The division said accidents and when daylight begins to fade and fatalities climb sharply at 4 p. m. traffic improvement approaches the day's peak.

Accidents resulted in property damage only fell off after 5 p. m. and declined steadily until the following morning. But fatal smash-ups reached the highest point of the day between 6 and 7 p. m. and remained high until

11 p. m. "Sprinkler Irrigation" point out.

The publication, Pacific Northwest Bulletin Number 3 is a joint effort of the extension services in Oregon, Washington and Idaho. Copies are available from the Morrow County Agents office.

The bulletin discusses pros and cons of sprinkler irrigation, pointing out some of its advantages as well as the shortcomings. Sprinklers, couplings, laterals, screening and desilting, and pumping plants are discussed in some detail.

Among advantages pointed out for sprinkling are: land leveling is not necessary, available water is put to better use; drainage problems are reduced; erosion is kept to a minimum; and ditches and ditch cleaning are eliminated.

On the other hand, the publication says sprinklers are high priced in terms of the initial investment; power costs are continuous, moving laterals is a disagreeable and time-consuming job, and wind effects water distribution.

NATIONAL PRESS BUILDING
WASHINGTON, D. C.

By Anne Goode

Straw embroidery is making fashion news. It will be featured in dozens of ways this spring and summer on beach accessories, bags, millinery and shoes. It will appear as applique on many dress fabrics, too.

Mix catsup with mustard-with-horseradish for a wonderful sauce for hamburgers and frankfurters.

Did you know that you can change the color of print dresses? All-purpose dye makes it possible where the print combines white or a light shade with a darker one. When dyed, the light shade will take the new color, the dark shade remaining the same. In prints that combine two or more light colors, both shades will be changed into new color.

It's easy to make individual tarts in a regular pie plate, like this: With pastry cutter or sharp knife cut circle of dough into 6 even triangles. Bring sides up and press points together. Fit into an 8-inch plate. Fill as you would any fruit tart. Bake

after 2 in the morning.

Exactly 50 percent of all fatal accidents during the six-month period took place at night, the division pointed out, although there were not more than half as many cars on the road as in the daytime. A basic driver-error in most cases was an over estimation of the visibility headlights can give, safety officials stressed. Thirty-seven pedestrians were

**River Boat Bows
In Oregon Film**

A 42 year-old glamor girl of the Columbia River and Willamette Rivers of Oregon finally got around to making her film debut.

She is the famous sternwheeler struck and killed from January through June, well over half of them at night while wearing dark clothing. A pedestrian violation or unsafe action was noted in 65 percent of the fatal pedestrian mishaps.

Henderson, who was given leave of absence from her task of towing heavy steamers in the Columbia River area to play an important part in Universal-International's Technicolor "Bend of the River" at the Star Theater, starting Sunday.

The Henderson, built in 1910, is one of the few sternwheelers still in operation. Modernized with winches and electricity during her years of service, she was reverted to the styles of mid-19th century for her screen appearance.

**Tires Produced Under
Atomic Control**

You can get them now! Better tires made possible through the use of radioactive material from the atomic furnaces at Oak Ridge, Tennessee. Rays from a tiny piece of STRONTIUM 90 penetrate and scientifically measure the thickness and weight of the rubberized fabrics used in these tires. This scientific control at the time of production promises you uniform, accurate materials—your assurance of top-quality tires.

Fortified with Cold Rubber

Amazing COLD RUBBER, the toughest tread-rubber ever developed, fortifies the tread of these long-wearing, durable tires. Cold Rubber, Scientific Production Controls and Highest Quality Materials and Workmanship throughout, have made possible a warranty of satisfaction that you get with no other tire.

You Get WRITTEN Protection

This WRITTEN Customer Satisfaction Contract protects you against BLOWOUTS, RIM CUTS, BRUISES and similar tire failures—with no time or mileage limit! It is yours for the full tread life of the tire.

Outstanding Performance Makes This Written Contract Possible

Controlled production of tire cords with new beta ray gauge at Gates plant in Denver.
