Wood Preservative Helps Guard Home From Weather Wear

A new "raincoat" that protects houses against weather damage, such as blistered paint and rotting wood, is now available as a water-repellent wood preservative, according to Charles Ross, Oregon State college forestry specialist.

The preservative is pentachlorophenol, often referred to simply as "penta." It is sold under various trade names, already mixed in a water repellent solution, or as a concentrate to be mixed according to directions on the label.

Wood siding, especially when it has not been recently painted, soaks up moisture rapidly when subjected to a driving rain or water running down over it. Tell-tale signs are paint blisters or

streaky stains from wood, building paper or rusty nails.

Before repainting a house, Ross suggests scraping and sanding blistered areas. Then, before applying new paint, brush a penta water-repellent preservative into overlap joints, butt ends, and all joints on door and window trims and house corners. Penta treatment is especially important where old paint has loosened. Excess penta that runs down over the paint should be wiped off with a cloth dampened with paint thinner. Allow the penta to dry thoroughly before the house is repainted.

In replacing rotted siding, Ross advises first soaking or dipping the new wood in a penta solution. Persons building new houses may be able to obtain treated lumber since many lumber yards are now installing wood-treating equipment. Added life in the wood and lower repair bills will justify the expense of the treatment, Ross said.

Fishermen can't be too careful with fire in the forest. One fire started by a carelessly dropped cigarette or a campfire left untended can destroy a forest. Good fishermen are good woodsmen, too. They're always careful with fire because they know green forests and good fishing go together.
