Mr and Mrs Peck flew to San Diego from Eugene.

Mr and Mrs Richard Catlin of Wasco, Oregon were weekend visitors with the O G Breeding Lyle Allyn is visiting in Oakland, California.

Lexington News

Area Bank Business Shows Slight Gain UNIVERSITY OF OREGON, Eugene.—A slight upturn in business in Oregon was evidenced in the bank debit reports for June. A total of \$1,660,602,574 was tallied by the 167 reporting banks and branches. This was up over the previous month by 0.9 per cent and up over June of 1957 by 3.2 per cent.

Bank debits, which represent the dollar value of checks drawn against the deposit accounts of individuals and business firms, are generally regarded as good indicators of current business activity. The University of Oregon's bureau of business research collects the debits monthly from banks of the state.

Umatilla and Morrow county banks in the Pendleton area had debits of \$28,928,481. The total from eight banks was up 5.8 per cent over May, 1958, and up 3.4 per cent over June, 1957.

Both chemicals belong to the chloro-benzolic-acid family and are now on the market. W R Furtick, OSC agronomist, reports up to 90 to 100 percent morning glory control with either trichloro benzolic acid (TBA) or polychloro benzolic acid (PBA).

Most spraying for weed control will be on small patches of morning glory even out in the Columbia Basin wheat country where the weed is a major problem, says Rex Warren, OSC farm crops specialist.

One-half of the chemical mixed with two to four quarts of water is recommended for spraying one square rod—an area 16 1/2 feet square. The cost: about 60 cents. A recommended mixture for spraying patches totaling one area is 10 gallons of the chemical to 40 to 80 gallons of water. TBA and PBA now sell for about \$10 a gallon.

Cost of treatment is comparable to other commonly-used soil sterilizing methods. Big advantage of the new materials is that soil does not remain sterile as long after treatment as does with other sterilants such as sodium chlorate.

Soil sterilized with sodium chlorate may cause loss of cropping for 3 to 10 years depending upon soil moisture. Warren reports. TBA or PBA sterilize the soil for about one year. Grains and corn are more tolerant to the chemical residue than are other crops.

Warren says beans are very susceptible to injury when planted a year following soil treatment. He cautions that TBA and PBA should be used cautiously in orchards and berry crops, since effect of the chemicals on these crops has not yet been tested.

TBA gave a better and faster kill of morning glory than did PBA in OSC tests. But Furtick says this advantage may be offset by the fact that PBA doesn't sterilize the soil quite as much. He suggests growers might try both materials to see which works best for them.

Chloro benzolic acids kill when absorbed directly by the plant or through the soil. Tests indicate, however, that weed control is best when most of the chemical comes in contact with the soil.

Treatments can be made anytime under Eastern Oregon conditions. Warren says mid-summer and early fall treatments look excellent. In western Oregon, treatment should be before September 1.

The chemical does not kill ungerminated seed. Seedlings appearing after the chemical has reached from the soil should be controlled with 24-D or by cultivation, the specialist says.

New Weed Killers Give Good Control Of Morning Glory

Two new weed killers tested by the Oregon State college agricultural experiment station look like the answer for control of wild morning glory—Oregon's most troublesome perennial weed pest.

Both chemicals belong to the chloro-benzolic-acid family and are now on the market. W R Furtick, OSC agronomist, reports up to 90 to 100 percent morning glory control with either trichloro benzolic acid (TBA) or polychloro benzolic acid (PBA).

Most spraying for weed control will be on small patches of morning glory even out in the Columbia Basin wheat country where the weed is a major problem, says Rex Warren, OSC farm crops specialist.

County Agent's News

(Continued from page 2) frame is used. This frame is placed under the combine and shattered grain counted in the square foot area. According to the authority, 18 to 20 kernels means a loss of one bushel of wheat; 14 to 16 oat kernels means the loss of one bushel of oats; 10 to 13 barley kernels means the loss of one bushel of barley; 21 to 24 kernels means the loss of one bushel of rye. While wind shatter some years is bad, it is reported that frequently as much as 5 to 10 bushels are lost by careless combine adjustment and operation.
