CAPITAL PARADE (Continued from page 2) TO BLOCK SELF PROMOTERS Wanted a law to prevent businessmen getting into government positions to promote their own business. Several Senators, apparently taking their cue from the Pres-

dent, have introduced two bills in the current legislature which would prevent anyone engaged in the transportation business from serving on a port commission. Senate Bill 107 relates to the Port of Portland, whose commissioners are appointed. Senate Bill 110 relates to the other port districts of the state whose commissioners are elected. In both cases, however, the sponsors hope to prevent the service of commissioners who are engaged in the transportation business, and who, as commissioners, are placed in a position to befriend and assist those who are engaged in their particular types of transportation. Port commissioners are granted, by law, tremendously broad powers. They may engage in any form of transportation business, they may subsidize water transportation, they may condemn private property—yes, including railroad property, they may levy taxes, and they may, through regulatory policies, serve indirectly to benefit one form of transportation over another. Sponsors of the bill point to many other situations of similar nature where the legislature has taken positive action to prevent conflicts of interests from arising. They mention, among others the law as applied to banking commissioners or liquor commissioners, neither of whom are permitted to have any personal connection whatsoever with the business they regulate and administer. HELLS CANYON ECHOES Senate approval of the appointment of Byron C Brinton as a member of the State Water Resources Board was objected to Wednesday by an Oregon Farm Bureau Federation agent. The basis of the objection was that the Baker publisher had supported the Hells Canyon dam and was an active foe of private ownership of public serving utilities. Robert Steward, former state legislator and state agriculture director, Senator Dwight Hopkins and Rep Clinton Haight testified in favor of Brinton. ON 1960 BALLOT An announcement was made Thursday by Rep Winton J Hunt, Woodburn, that he would introduce Gov Mark Hatfield's resolution providing for a vote at the 1960 election on the question of a new state constitution. A measure has already been introduced that would allow the legislature to enact a new constitution.

show resistance to DDT in some alfalfa seed areas, and onion maggots show signs of resistance to other pesticides. On a world-wide scale, eradication of malaria depends upon winning the race between resistance to chemicals by malaria mosquitoes and their control by modern chemicals, Terriere said. One of the difficulties involved in studying insect metabolism is their small size. In the OSC study, Terriere and Roubal are using radioactive materials and special micro-chemical techniques to probe the inner insect workings and find out how the insects take the complex toxic chemicals and convert them into non-toxic materials. They are feeding houseflies radioactive naphthalene (moth-balls) in a gelatin pudding. Then with the special equipment, they are tracing the radioactive material through the fly. In work to date, they have found that the flies convert the naphthalene into at least seven different materials. The OSC workers hope that when they learn how the moth-balls are metabolized within the insect, they will have an insight into the phenomenon of resistance since several of the modern insecticides are related chemically to naphthalene. When the insects' biochemical "defense mechanisms" are known, it may be possible to design new and lasting effective insecticides, they believe.

They are feeding houseflies radioactive naphthalene (moth-balls) in a gelatin pudding. Then with the special equipment, they are tracing the radioactive material through the fly. In work to date, they have found that the flies convert the naphthalene into at least seven different materials. The OSC workers hope that when they learn how the moth-balls are metabolized within the insect, they will have an insight into the phenomenon of resistance since several of the modern insecticides are related chemically to naphthalene. When the insects' biochemical "defense mechanisms" are known, it may be possible to design new and lasting effective insecticides, they believe.

show resistance to DDT in some alfalfa seed areas, and onion maggots show signs of resistance to other pesticides. On a world-wide scale, eradication of malaria depends upon winning the race between resistance to chemicals by malaria mosquitoes and their control by modern chemicals, Terriere said. One of the difficulties involved in studying insect metabolism is their small size. In the OSC study, Terriere and Roubal are using radioactive materials and special micro-chemical techniques to probe the inner insect workings and find out how the insects take the complex toxic chemicals and convert them into non-toxic materials. They are feeding houseflies radioactive naphthalene (moth-balls) in a gelatin pudding. Then with the special equipment, they are tracing the radioactive material through the fly.
