## Spring report on new wheat herbicide:

# There's still time to protect yields with Igran.

New safe Igran® herbicide will control gromwell, henbit, tarweed, purple mustard, dogfennel, bedstraw, fanweed, foxtail, speedwell, chickweed and other problem weeds. It can be sprayed safely anytime until weeds are four inches high.

If you put off a fall application of Igran because dry, cool or snowy weather delayed weed germination, it's still not too late for Igran to solve your special weed problems. The weeds 2,4-D doesn't get.

University and commercial data shows that a late winter or early spring post-emerge application of Igran will still do a job on those tough annual weeds and grasses. The kind of a job that will protect yields and give a good return on your investment.

You see, Igran isn't limited to a rigid, critical spray period. It's the first herbicide you can apply pre-emerge or post, by ground or air, with liquid fertilizer, anytime until weeds are four inches high. This, because wheat has a higher tolerance

for Igran than for any other herbicide now in use.
