Swimming lessons offer Valuable Skills

Fun in the sun at Heppner Municipal Swimming Pool.

For whatever reason-recreation, competition or just to cool off on a hot summer's day, learning to swim is important to young and old alike.

The Heppner and Ione pools offer Red Cross Learn-to-Swim program and this summer have had a gratifying enrollment for the sessions

The classes offered are Beginner, Advanced Beginner, Intermediate, Swimmer, Junior and Senior Lifesaving.

In order to advance to the next class, one must first learn and perform a series of swimming skills.

A beginner must jump into deep water, level off and back to the starting point; halfway back, turn over on the

back, rest in a floating position for 30 seconds; turn from back to front and continue to swim back to starting point. These are the most elementary skills any swimmer should possess.

In order to pass Advanced Beginner, one must dive into deep water, swim 15 feet underwater, surface, tread water / m'nute, swim crawl stroke for 20 yards; jump into deep water, surface, perform 2-minute survival float, and swim elementary backstroke, 20 yards.

Intermediates must perform (1) three leg strokes, 20 yards each; (2) three arm swim 15 yards; turnand swim strokes, 10 yards each; (3)

50 yards, elementary backstroke; (4) 100 yards, selected stroke; (5) Turns, front and back; (6) Survival floating 5 minutes; (7) 10 yards, scull: (8) tread water, 1 minute; (9) Float, 1 minute; (10) Underwater swim, 15 feet: 11) Standing front dive; (12) Rescue skills; (13) 5-minute

The swimmer must possess the following skills: (1) 100 vds, breast stroke; 100 yds. side stroke; (3) 100 yds, back crawl or trudface dive; (7) Tread water 1 minute; (8) Plunge dive; (9) Running front dive; and

gen crawl; (4) 50 yds. back swim (legs alone); (5) turns (for closed course); (6) Sur-(10) 10-minute swim.

Lightning Strikes lone Home

Early-morning lightning between 6:00 and 6:30 Monday caused minor damage in different parts of the county.

Columbia Basin Electric Co-op in Heppner reported several power outages, requiring from two to six hours to restore. Lightning burned out the transformer at the Don Heliker ranch outside of Ione. It struck a power pole near Ione that caught fire, but the fire was extinguished and the pole will not have to be replaced. Power was also out at the McNabb

Elevator. Perhaps the worst results of the electrical storm were at the Lewis Halvorsen ranch outside Ione. The family was asleep when the lightning struck there about 6:00. It ruined the TV tower, and in turn the high voltage shot through some of the house circuits blowing out the TV. refrigerator and a clock. The curtains also burned, as a result of the lightning.

The Associated Press Reports Washington State University animal scientist is researching the potential of speeding up the beef production cycle by chemically forcing the early birth of calves.

Dr. Clayton O'Mary said five calves have been delivered in the preliminary investigations and while there have been some problems with the procedures, he is optimistic and research can eventually significantly improve the efficiency of beef cowcalf operations.

O'Mary's early work involved five Hereford heifers which were bred to an Angus bull at a range of ages between 11 months, 7 days and 12 months 25 days. The heifers were managed in normal fashion until with in 35 to 15 days of their natural calf delivery date he said. At that time the heifers

were injected with a synthetic hormone, dexamethasone, which induced labor and resulted in the birth of the calves 39 to 54 hours later, O'Mary said,

At birth all calves appeared healthy, he said, although the one born 35 days early died within a few days. "We don't know what com-

plications caused its death," he said. "It was lively at birth, although it weighed less than 50 pounds." O'Mary said the remaining

animals gained rapidly, with the three oldest averaging slightly more than 53 lbs. per calf during their first 35 days. The highest 35-day gain was 62 pounds and the lowest 46 pounds, he said.

O'Mary said chemically forcing early birth of the calves offers several potential advantages provided further research can refine the pro-

WSU testing early calving technique cess and make it practical

for some cattlemen and less difficult for the cow. The process will allow heifers to have smaller calves or reduce the size of calves from "big calf' breeds that often cause calving difficulties even in mature cows,

he said. By allowing them to have smaller calves, heifers could be bred at earlier ages, thus reducing the cost of maintaining a heifer until she has her first calf, he said,

O'Mary said it also would speed up the beef production cycle by shortening the gestation period and allowing the cow extra time to get back into condition for rebreeding.

"Way Back When"
